CHAPTER 1

GENERAL INFORMATION

1-1. INTRODUCTION.

1-2. This Technical Manual describes Antenna Couplers CU-1382F/FRR and CU-1382G/FRR (hereafter also referred to as the CU-1382F/FRR or CU-1382G/FRR or antenna couplers when discussion pertains to both), and includes operation; functional description; scheduled maintenance; troubleshooting; corrective maintenance; and installation procedures; and a parts list for these units. The antenna couplers are shown in Figure 1-1.

1-3. FUNCTIONAL DESCRIPTION.

1-4. The antenna couplers are designed for shore communication use and are broadband, wide range, solid state devices. These antenna couplers provide eight receiver inputs from one antenna. The receivers operate independently without adjustment to the antenna coupler. The operating frequency range of the antenna couplers is 2 to 32 MHz. The antenna couplers are physically and electrically similar. The discussions within this manual will relate to both type of antenna couplers unless otherwise noted.

1-5. PHYSICAL CHARACTERISTICS. The antenna couplers are housed in an aluminum chassis, with radio frequency interference shielding. The front panel is designed for a 19-inch rack and provides for relay rack mounting. The operating control and indicators are located on the front panel and all power and signal connections are made on the rear of the chassis. The three modules are interconnected by cable assemblies for ease of maintenance.

1-6. ELECTRICAL CHARACTERISTICS. The antenna coupler provides eight isolated but identical rf signal outputs from one input signal. Each output signal has a nominal insertion gain of 2 ± 1 dB. The antenna coupler also has provisions for attenuation of undesired signals from both out-of-band input and ac line sources. The CU-1382G/FRR has a phase tracking capability. Except for the ac input circuit, all components are mounted on replaceable modules.

1-7. REFERENCE DESIGNATIONS. Reference designations and the function of the electronic assemblies of the antenna couplers are listed in table 1-1. Figure 1-2 shows the location of the electronic assemblies.

1-8. REFERENCE DATA.

1-9. Antenna couplers, CU-1382F/FRR and CU-1382G/FRR manufactured by Aiken Electronics/Aero Geo Astro (part numbers 34-120-1 and 34-120-2), operate from 105 to 250 VAC, single phase, 50 to 60 Hz. Table 1-2 lists a summary of the electrical characteristics of the antenna couplers.

1-10. EQUIPMENT SUPPLIED.

1-11. Equipment supplied with the antenna coupler is listed in table 1-3.

1-12. EQUIPMENT AND PUBLICATIONS REQUIRED BUT NOT SUPPLIED.

1-13. Test equipment and publications required but not supplied with the antenna coupler are listed in table 1-4.

1-14. FACTORY AND FIELD CHANGES.

1-15. Factory and Field changes made to the antenna couplers CU-1382F/FRR and CU-1382G/FRR are listed in tables 1-5 and 1-6.

Table 1-1. Antenna Coupler, Assemblies and Reference Designations

REFERENCE DESIGNATION	ASSEMBLY/SUBASSEMBLY NAME	FUNCTION
A1	RF Filter	Filters frequency bands below 1.6 MHz and 40 MHz above extending to 150 MHz.
A2	Divider Assembly	Divides one input antenna signal into 8 receiver signals.
A3	Power Supply Assembly	Converts input ac power to a regulated +23.5 vdc.
A3A1	Regulator Assembly	Provides voltage regulation for +23.5 vdc supply.

Table 1-2. Antenna Couplers, Functional Characteristics

Frequency Range		2 to 32 MHz with rf Filter
Input Impedance		50 ohms, nominal, unbalanced
Input VSWR		No greater than 1.5:1
Insertion Gain		2 ± 1 dB for most units, (3 ± 2 dB per specification
Gain Tracking (CU-1382G/FRR)		±0.5 dB
Phase Tracking (CU-1382G/FRR)		±2° maximum (phase standard)
RF Filter Attenuation (CU-1382F/FRR)	nominal	-50 dB, 14 KHz to 1.6 MHz -35 dB, 40 MHz to 80 MHz -40 dB, 80 MHz to 150 MHz See figure 3-2

Table 1-2. Antenna Couplers, Functional Characteristics (Cont)

RF Filter Attenuation (CU-1382G/FRR)	nominal	-28 dB, 14 KHz to 1.6 MHz -30 dB, 40 MHz to 150 MHz See figure 3-2
RF Signal Overload Protection		Greater than 10 volts rms (2-32 MHz)
Intermodulation Products	2 to 32 MHz:	Better than -65 dB below two 0.5 volts rms input signals
	32 to 60 MHz:	Better than -55 dB below two 0.5 volt rms input signals
Noise Figure		7.0 dB nominal 8.4 dB maximum
MTBF		30,000 hours
Ambient Temperature Limitations	Operating:	40°C to +50°C (-40°F to 122°F)
	Nonoperating:	-62°C to +75°C (-80°F to 167°F)
Output Impedance		50 ohms nominal, unbalanced
Output VSWR		No greater than 1.5:1
Output-to-Input Isolation		50 dB minimum
Output-to-Output Isolation		Greater than 40 dB

CHAPTER 2

OPERATION

2-1. INTRODUCTION.

2-2. The antenna couplers, once installed require only that the operator turn it on. The antenna couplers are usually located in a remote and unattended location, and must be operated in conjunction with a receiver system.

2-3. OPERATING CONTROLS AND INDICATORS.

2-4. The only operator control is the POWER ON-OFF switch. Table 1-1 lists the front panel controls, and indicators. Figure 2-1 illustrates the front panel of the antenna coupler.

2-5. TURN ON-TURN OFF PROCEDURE.

2-6. To turn on the antenna coupler, set the POWER ON-OFF switch 1S1 in the ON position, lamp 1DS1 is illuminated. To turn off the antenna coupler, place the POWER ON-OFF switch 1S1 in the OFF position, lamp 1DS1 is extinquished.

2-7. MAINTENANCE CONNECTORS.

2-8. Table 2-2 lists the connectors used for maintenance of the antenna couplers and are shown in Figure 2-2. Table 2-2 list the maintenance connectors by name and operating function.

Table 2-1. Operating Control and Indicators

REFERENCE DESIGNATION	NAME	POSITION	OPERATING FUNCTION
1DS1	Power on Indicator Lamp		Lights when POWER ON-OFF switch 1S1 is in the ON position.
1F1, 1F2	1 AMP fuse		Protects antenna coupler against overload: indicator glows when fuse is open.
1F3	SPARE fuse		Stores (spare) one ampere, Slo-Blo fuse.
1S1	POWER switch		Used to turn on and off antenna coupler.
		ON	Power applied to antenna coupler
		OFF	No power applied to antenna coupler

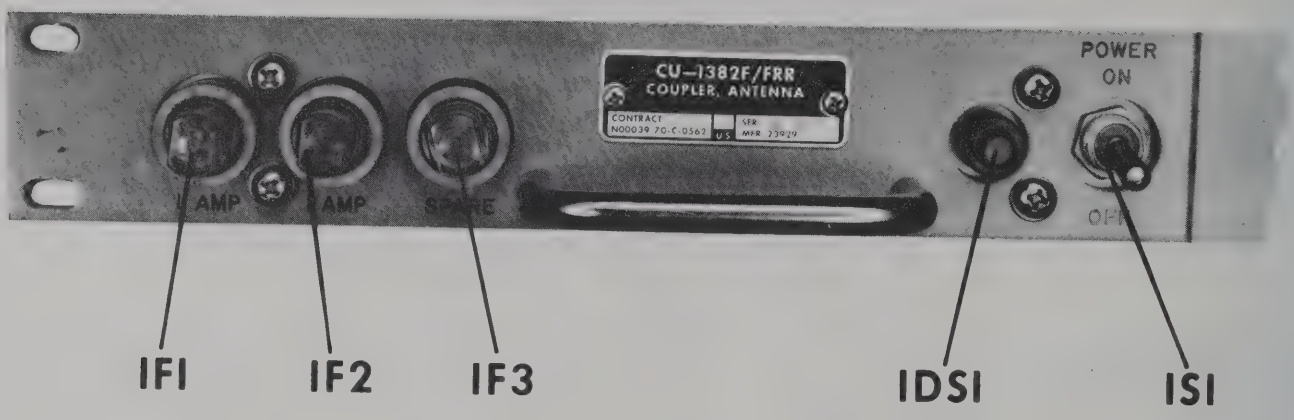

Figure 2-1. Antenna Coupler, Operating Controls and Indicators

Table 2-2. Maintenance Connectors

REFERENCE DESIGNATION	NAME	OPERATING FUNCTION
1A2J3 thru 1A2J10	OUTPUTS 1 thru 8 BNC Connectors	Connects antenna coupler outputs to eight receivers. Rf signals identical in characteristics as INPUT signal.
1J1	Ac Connector	Connects ac power from source to antenna coupler
1J2	INPUT BNC Connector	Connects antenna rf signal to antenna coupler.

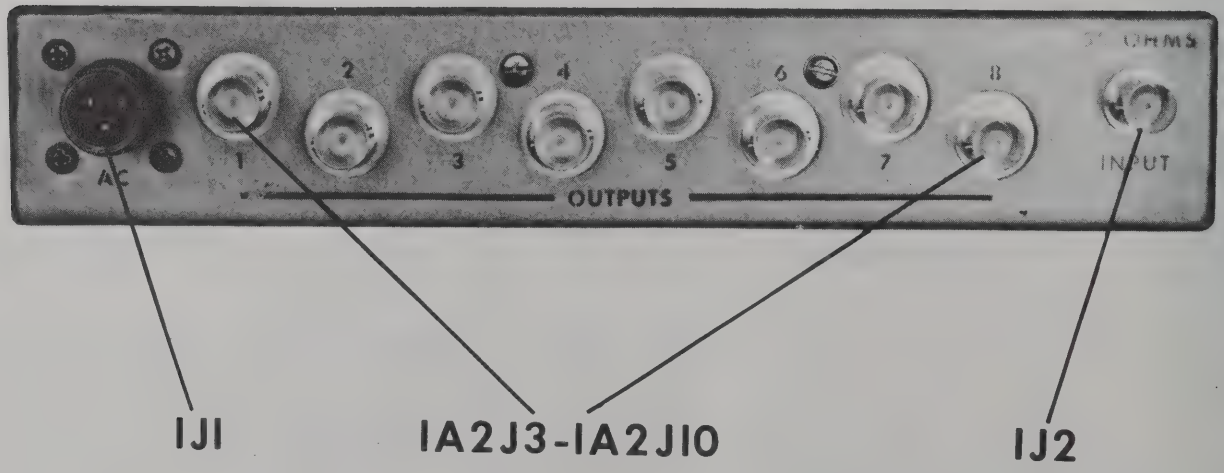

Figure 2-2. Antenna Coupler, Rear Panel Connectors

CHAPTER 3

FUNCTIONAL DESCRIPTION

3-1. INTRODUCTION.

3-2. This chapter describes the principles of operation of the antenna coupler. The description is presented in two levels. The first level is an overall functional description of the antenna coupler to the level of detail shown on the functional block diagram. The second level is a more detailed discussion based on the RF signal flow diagram, power distribution diagram and the maintenance schematic diagrams. Detailed circuit descriptions are discussed in this second level when the electronic circuits differ substantially from those covered in NAVSHIPS 0967-000-0120.

3-3. OVERALL FUNCTIONAL DESCRIPTION.

3-4. An overall functional block diagram of the antenna coupler is given in Figure 3-1. The order of presentation in the figure and the text below follows the signal flow through the antenna coupler from rf input from the antenna to the eight rf outputs to the receivers.

3-5. The rf signal from the antenna passes through the rf filter 1A1 where all rf signals below 2.0 MHz and above 32 MHz are attenuated. The filtered rf signal is then fed to the divider assembly 1A2, where the one rf input signal is divided into eight rf output signals. The divider assembly of the divider assembly contains a high level signal protector relay 1A2K1 that opens when an input signal level greater than 5 vrms (nom) occurs. The rf signal is then applied to emitter followers 1A2Q2 and 1A2Q3, where a gain of approximately 1 dB is experienced. The emitter follower outputs are paralled to eight emitter follower circuits, consisting of 1A2Q4 through 1A2Q11. A gain of approximately 1 dB occurs at each of these emitter follower outputs, which are also the eight rf signal outputs to the receivers.

3-6. The ac power is applied through the ac line filters 1FL1 and 1FL2 to the power supply 1A3. The filters are used to prevent rf interference from entering the antenna coupler from the input power source. The power supply reduces the input voltage and rectifies and regulates it for an output voltage of +23.5 Vdc regulated. The regulated voltage is applied to the divider assembly 1A2 and provides the transistor operating voltage.

3-7. MAJOR FUNCTIONAL AND CIRCUIT DESCRIPTIONS.

3-8. GENERAL. The antenna coupler performs one function and that is to divide one rf signal input into eight rf signal degradation. The description that follows are based on the rf signal flow diagram, power distribution diagram and the maintenance schematics of each of the subassemblies and are contained in Chapter 5. Troubleshooting procedures, maintenance turn on procedures, and test data are contained in Chapter 5 also.

3-9. RF SIGNAL DISTRIBUTION.

3-10. GENERAL. Refer to the rf signal flow diagram Figure 5-1 for the following discussion. The antenna rf signal is applied to the rf filter 1A1 through the BNC jack 1J2. The rf filter 1A1, a 2 to 32 MHz bandpass filter, eliminates the out-of-band signals. The filtered rf signal is passed through cable assembly 1W1 to the divider assembly 1A2. The input circuit of the divider assembly consists of resistor 1A2R5 in parallel with the contacts of signal protector relay 1A2K1. The relay contacts are shown in the unenergized position. When power is applied to the divider assembly, the relay contacts close, permitting the rf signal to flow through the contacts. In the event of an rf signal greater than 5 volts rms (nom) the relay contacts open permitting the rf signal to pass only through resistor 1A2R5 thereby reducing the rf signal level sufficiently to avoid damaging the emitter followers. The circuit consisting of transformer 1A2T1 and emitter followers 1A2Q1 and 1A2Q2 provides a push-pull circuit with two outputs, 180° out of phase. These two signals are connected to the input of the eight emitter followers 1A2Q4 through 1A2Q11 which operate as push-pull circuits and provide a 1 dB gain. The outputs of the emitter follower pairs (1A2Q4 - 1A2Q5, for example) are fed to transformer 1A2T2, 1A2T4, 1A2T6, and 1A2T8, which provide the single ended drive for the output transformers 1A2T3, 1A2T5, 1A2T7, and 1A2T9. These transformers, with the matching networks (1A2L6 - 1A2R19, 1A2L7 - 1A2R25, 1A2L8 - 1A2R31, 1A2L9 - 1A2R37) form four balanced hybrid transformers with greater than 40 dB isolation between outputs. These outputs (two from each hybrid circuit) feed the eight output ports, 1A2J3 through 1A2J10 and provide greater than 40 dB isolation between output pairs 1A2J3 - 1A2J4, 1A2J5 - 1A2J6, 1A2J7 - 1A2J8, 1A2J9 - 1A2J10. The isolation between ports other than the listed parts is obtained from the emitter follower driver isolation.

3-11. RF FILTER, 1A1, PN34-0121, CU-1382F/FRR. Refer to the maintenance schematic of the rf filter figure 5-6, for the following discussion. This filter has a high band edge rejection capability, minimum insertion loss, and hence minimum contribution to the antenna coupler noise figure. This filter is an elliptic function type bandpass filter consisting of a low pass input filter and high pass output filter with a 50 ohm nominal impedance. The bandpass frequency range is 2 to 32 MHz, with the upper skirt in the band of 32 to 40 MHz and the lower skirt in the band of 1.6 to 2 MHz. Refer to figure 3-2, the attenuation in the 14 kHz to 1.6 MHz band is -50 dB and in the 40 to 80 MHz band is -30 dB. In the 80 to 150 MHz band the attenuation is -40 dB.

3-12. The input rf signal from the antenna is applied to the input jack 1A1J1. The low pass filter consisting of 1A1L1, 1A1L3, 1A1L5, 1A1L7, and the components connected to ground, 1A1C1, 1A1L2, 1A1C2, 1A1L4, 1A1C3, 1A1L6, and attenuate the frequencies above 32 MHz, with a skirt between 32 and 40 MHz. The high pass filter output consisting of 1A1C4, 1A1C6, 1A1C8, 1A1C9, 1A1C11, and the components connected to ground 1A1C5 and 1A1L8, 1A1C7 and 1A1L9, 1A1C10 and 1A1L11 attenuate the frequencies below 2 MHz with a skirt in the band 1.6 to 2 MHz. The band pass filtered rf signal is then fed through the output connector 1A1J2 to the divider assembly 1A2.

3-13. RF FILTER, 1A1, PN34-0122. CU-1382G/FRR. Refer to the maintenance schematic of the rf filter figure 5-7 for the following discussion. The filter has a high band edge rejection capability, minimum insertion loss, and a minimum contribution to the antenna coupler noise figure. This filter is an elliptic bandpass filter consisting of a low pass input and a high pass output with a 50 ohm impedance. The bandpass

frequency range is 2 to 32 MHz, with an upper skirt in the band of 32 to 40 MHz, and a lower skirt in the band of 1.6 to 2 MHz. Refer to figure 3-2, the attenuation versus frequency plot for the RF filter. The minimum attenuation in the 14 kHz to 1.6 MHz band is -28 dB in the 40 to 50 MHz band is 30 dB.

3-14. The rf input signal from the antenna is applied to the input jack 1A1J1. The low pass input section consisting of 1A1L1, 1A1L3, 1A1L5, and the components connected to ground, 1A1C1 and 1A1L2, 1A1C2 and 1A1L4, and 1A1C3 attenuate the frequencies above 32 MHz, with a skirt between 32 and 40 MHz. The high pass output section consisting of 1A1C6 and 1A1C9 and the components connected to ground, 1A1C5 and 1A1L8, 1A1C7 and 1A1L9, 1A1C10 and 1A1L11, attenuate the frequencies below 2 MHz, with a skirt in the band of 1.6 to 2 MHz. The bandpass filtered rf signal is then fed through the output connector 1A1J2 to the divider assembly 1A2.

3-15. DIVIDER ASSEMBLY, PN34-0086-1, CU-1382F/FRR. Refer to the maintenance schematic of the divider assembly, figure 5-8. The divider assembly is used to divide the one reciever input signal into eight rf output signals with no degradation in input signal characteristics. The divider assembly has an rf signal input protection circuit and provides a high output-to-output isolation. The input rf signal also experiences a gain of approximately 2 dB at the output.

3-16. The rf signal from the rf filter 1A1 is applied to the BNC input jack 1A2J2 through a parallel circuit consisting of resistor 1A2R5 and the contacts of relay 1A2K1. These contacts are open in the unenergized state. When +23.5 volts dc is applied to the divider assembly and the rf input signal level is less than 5 volts rms, relay 1A2K1 is energized. closing the contacts. Therefore, the signal flows through the closed contacts of 1A2K1 to the input transformer 1A2T1, bypassing 1A2R5.

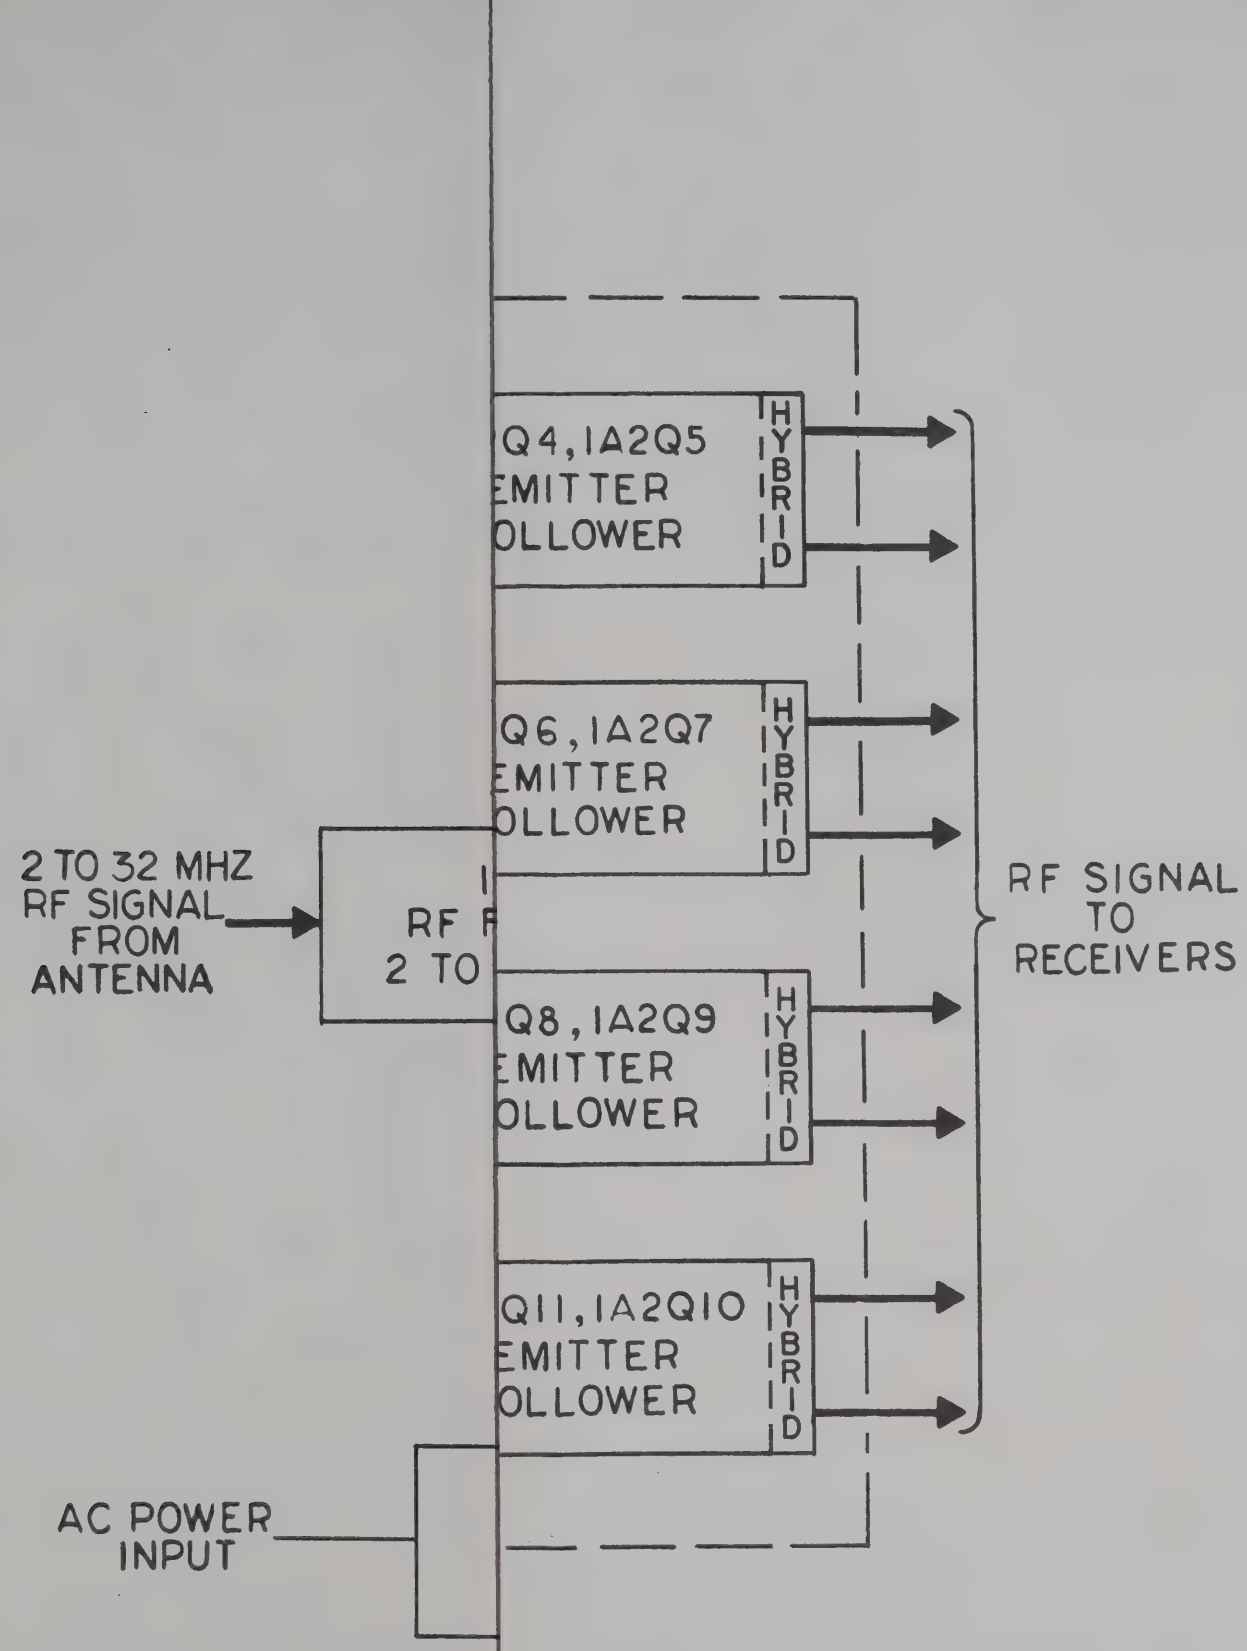
3-17. When the rf input signal is greater than 5 volts rms, the contacts of relay 1A2K1 open, passing the rf signal through resistor 1A2R5, where there is a drop in level sufficient to prevent damaging the emitter followers in the divider circuit. The power supply 1A3 has current limiting, which is set 15 or 20% higher than the normal current requirements. When the rf input signal is greater than 5 volts rms, the transistors in the divider assembly 1A2 will draw more current, dropping the +23.5 volts dc to some lower voltage, causing capacitors 1A2C10 and 1A2C11 to discharge through diode 1A2CR1. As the base voltage of transistor 1A2Q3 drops below the +5.3 volt reference voltage of Zener diode 1A2CR3, transistor 1A2Q3 is cut off. With transistor 1A2Q3 cut off, relay 1A2K1 is de-energized, opening the contacts, enabling the rf signal to flow through resistor 1A2R5. Resistor 1A2R5 reduces the input signal by 18 to 20 dB. With relay 1A2K1 open, the power supply comes out of the current limiting state, charging capacitors 1A2C10 and 1A2C11 through resistor 1A2R6. The bias point of transistor 1A2Q3 is set up by the bleeder combination consisting of 1A2R6, 1A2R7 and 1A2R8, further slowing the charging time of capacitors 1A2C10 and 1A2C11. The RC charge time is approximately 0.8 seconds for an rf input signal of 10 volts rms. Relay 1A2K1 closes for approximately 15 milliseconds and then opens. In the event the strong signal is still present, the relay will reopen and the cycle is repeated until the strong signal is removed. Zener diode 1A2CR2 is used to assure that capacitors 1AC10 and 1A2C11 charge properly in cold operating temperatures when leakage current is higher than normal. Capacitor 1A2C9 is used to prevent erractic operation of relay 1A2K1. Resistor 1A2R9 is used to set up the 5.6 volt reference voltage

of Zener 1A2CR3. The resistor holds the reference voltage for a sharp cut off when the +23.5 volts is dropping. This occurs in an rf signal input overload condition.

3-18. The divider assembly active circuits are emitter followers connected in a push-pull configuration. Since emitter followers normally provide less than unity gain, gain is obtained by the use of stepup transformers. Both the input and output circuits contain this type of transformer. The output-to-output isolation is accomplished by a transformer hybrid circuit. A simplified schematic of the transformer hybrid circuit is shown in figure 3-3. When a signal is applied across Rc two voltages of equal amplitude and three dB lower than the input signal will appear across both Rb and Rd. If this transformer is properly terminated at all ports, no signal power will be dissipated in Ra. When a signal is applied to Rb, the signal will divide equally between Ra and Rc and a very small amount across Rd (40 dB down or more from Rb). This isolation is dependent upon the terminating impedances at Ra and Rc. In the divider assembly, since stepup ratios are used in the transformers to provide gain, the terminating impedances are higher than shown in the simplified schematic.

3-19. The push-pull circuit consists of emitter followers 1A2Q1 and 1A2Q2, transformers 1A2T1 and all the attached components. Voltage divider resistors 1A2R1 and 1A2R2 set up the bias voltage of the emitter followers 1A2Q1 and 1A2Q2. Since the output emitter followers 1A2Q4 through 1A2Q11 are dc coupled to the input emitter followers 1A2Q1 and 1A2Q2, 1A2R1 and 1A2R2 are also set up their bias voltage. The emitter bias 1A2R11 and 1A2R12 of emitter followers 1A2Q1 and 1A2Q2, maintain a +9.2 volt level at the emitter. Capacitor 1A2C1, 1A2C2, 1A2C8 and inductor 1A2L1 are used for ac isolation. Inductors 1A2L4 and 1A2L5 provide high frequency peaking and resistor 1A2R10 and 1A2R13 provide the load matching for the collectors of 1A2Q1 and 1A2Q2. These components provide 50 dB attenuation between input and output rf signals. Ferrite beads are used throughout the divider assembly as rf energy absorbers. Ferrite beads are used on capacitor leads to reduce the series Q thus, reducing the tendency to cause undesired oscillations. The dc blocking capacitors 1A2C3 and 1A2C4 provides protection for input transformer 1A2T1, in the event a dc voltage is applied to the rf input of the divider assembly. The impedance matching network at the secondary of transformer 1A2T1 consisting of capacitor 1A2C5, resistors 1A2R3 and 1A2R4, and inductors 1A2L2 and 1A2L3 provides the 50 ohm impedance match. The value of capacitor 1A2C5 is selected for optimum match, and may not be required. Refer to the maintenance schematic figure 5-8 for a nominal value. The values of capacitors 1A2C6 and 1A2C7 are selected to provide ac balance to the input of transformer 1A2T1.

3-20. The four inputs of the output circuits (1A2Q4 through 1A2Q11) are parallel connected, and driven from the push-pull input circuit pair 1A2Q1 and 1A2Q2. The four push-pull output circuits are identical, therefore, only one will be discussed. Resistors 1A2R14 and 1A2C12 are rf decoupling components. The rf impedance match of the one ohm emitter impedance of 1A2Q4 and 1A2Q5 to the 26 ohms impedance required by each half of the primary of transformer 1A2T2 is provided by resistors 1A2R22 and 1A2R23. The third resistor of this network, 1A2R30, is connected to the center tap of the primary of 1A2T2 to provide the proper dc bias to the emitter follower pair 1A2Q4 and 1A2Q5. The series reactance of transformer 1A2T2 must be tuned out to provide an impedance match to transformer 1A2T3 for hybrid operation. The variable capacitor 1A2C17 in parallel with capacitor 1A2C16 is adjusted for



a Coupler, Overall Functional Block Diagram

of Zener 1A2CR3. The resistor holds the reference voltage for a sharp cut off when the +23.5 volts is dropping. This occurs in an rf signal input overload condition.

3-18. The divider assembly active circuits are emitter followers connected in a push-pull configuration. Since emitter followers normally provide less than unity gain, gain is obtained by the use of stepup transformers. Both the input and output circuits contain this type of transformer. The output-to-output isolation is accomplished by a transformer hybrid circuit. A simplified schematic of the transformer hybrid circuit is shown in figure 3-3. When a signal is applied across Rc two voltages of equal amplitude and three dB lower than the input signal will appear across both Rb and Rd. If this transformer is properly terminated at all ports, no signal power will be dissipated in Ra. When a signal is applied to Rb, the signal will divide equally between Ra and Rc and a very small amount across Rd (40 dB down or more from Rb). This isolation is dependent upon the terminating impedances at Ra and Rc. In the divider assembly, since stepup ratios are used in the transformers to provide gain, the terminating impedances are higher than shown in the simplified schematic.

3-19. The push-pull circuit consists of emitter followers 1A2Q1 and 1A2Q2, transformers 1A2T1 and all the attached components. Voltage divider resistors 1A2R1 and 1A2R2 set up the bias voltage of the emitter followers 1A2Q1 and 1A2Q2. Since the output emitter followers 1A2Q4 through 1A2Q11 are dc coupled to the input emitter followers 1A2Q1 and 1A2Q2, 1A2R1 and 1A2R2 are also set up their bias voltage. The emitter bias 1A2R11 and 1A2R12 of emitter followers 1A2Q1 and 1A2Q2, maintain a +9.2 volt level at the emitter. Capacitor 1A2C1, 1A2C2, 1A2C8 and inductor 1A2L1 are used for ac isolation. Inductors 1A2L4 and 1A2L5 provide high frequency peaking and resistor 1A2R10 and 1A2R13 provide the load matching for the collectors of 1A2Q1 and 1A2Q2. These components provide 50 dB attenuation between input and output rf signals. Ferrite beads are used throughout the divider assembly as rf energy absorbers. Ferrite beads are used on capacitor leads to reduce the series Q thus, reducing the tendency to cause undesired oscillations. The dc blocking capacitors 1A2C3 and 1A2C4 provides protection for input transformer 1A2T1, in the event a dc voltage is applied to the rf input of the divider assembly. The impedance matching network at the secondary of transformer 1A2T1 consisting of capacitor 1A2C5, resistors 1A2R3 and 1A2R4, and inductors 1A2L2 and 1A2L3 provides the 50 ohm impedance match. The value of capacitor 1A2C5 is selected for optimum match, and may not be required. Refer to the maintenance schematic figure 5-8 for a nominal value. The values of capacitors 1A2C6 and 1A2C7 are selected to provide ac balance to the input of transformer 1A2T1.

3-20. The four inputs of the output circuits (1A2Q4 through 1A2Q11) are parallel connected, and driven from the push-pull input circuit pair 1A2Q1 and 1A2Q2. The four push-pull output circuits are identical, therefore, only one will be discussed. Resistors 1A2R14 and 1A2C12 are rf decoupling components. The rf impedance match of the one ohm emitter impedance of 1A2Q4 and 1A2Q5 to the 26 ohms impedance required by each half of the primary of transformer 1A2T2 is provided by resistors 1A2R22 and 1A2R23. The third resistor of this network, 1A2R30, is connected to the center tap of the primary of 1A2T2 to provide the proper dc bias to the emitter follower pair 1A2Q4 and 1A2Q5. The series reactance of transformer 1A2T2 must be tuned out to provide an impedance match to transformer 1A2T3 for hybrid operation. The variable capacitor 1A2C17 in parallel with capacitor 1A2C16 is adjusted for

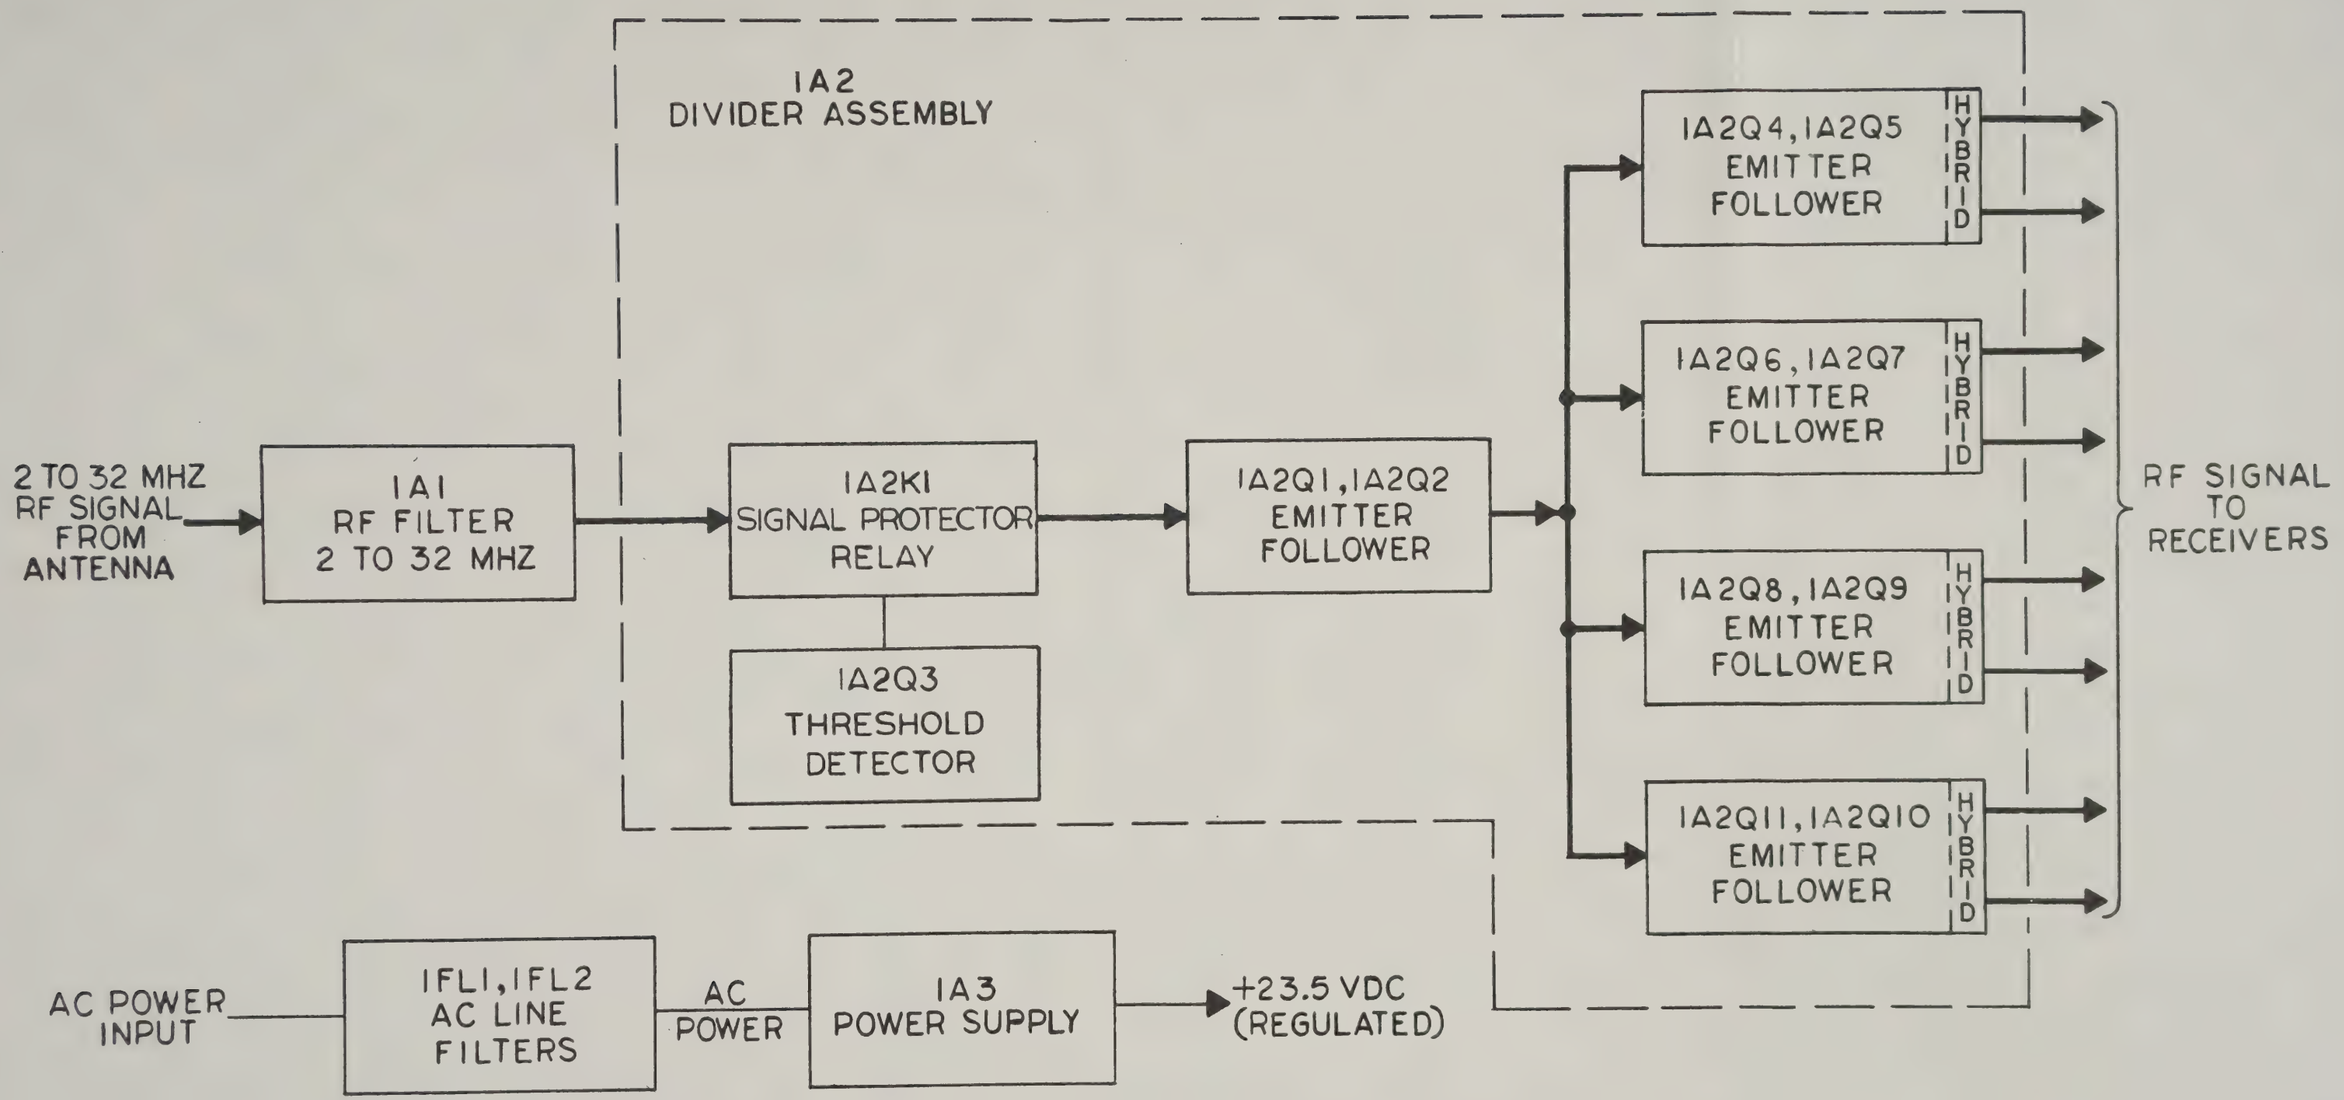


Figure 3-1. Antenna Coupler, Overall Functional Block Diagram

maximum output-to-output isolation. The impedance ratios of transformers 1A2T2 and 1A2T3 were selected to obtain a slight voltage gain. Resistor 1A2R34 provides the termination for T3 necessary for maximum hybrid isolation. Inductor 1A2L6 provides optimum isolation at the high end of the frequency band. The reactance for a 50 ohm impedance at the output jack 1A2J3 and 1A2J4 is obtained by capacitors 1A2C24 and 1A2C25.

3-21. DIVIDER ASSEMBLY, 1A2, PN34-0086-2, CU-1382G/FRR. Figure 5-9 is the maintenance schematic. This divider assembly is similar to divider assembly, 1A2, PN-0086-1 except for the addition of capacitors 1A2C32 through 1A2C39, used for the phase tracking requirement of the CU-1382G/FRR. Refer to paragraph 3-15 for the detailed discussion of the divider assembly. The rf signal is fed to transformers 1A2T2, 1A2T4, 1A2T6, and 1A2T8 in phase with each other, to their respective output transformers 1A2T3, 1A2T5, 1A2T7, and 1A2T9. Since the rf signal is applied to the center taps of the output transformers, the rf signal voltage splits and is in phase at both ends of the primary winding. The adjustable capacitors 1A2C32 through 1A2C39 are connected to each end of the primary winding of the output transformers 1A2T3, 1A2T5, 1A2T7, and 1A2T9 to compensate for the accumulation of small differences intolerances in components and differences in lead length. Phase tracking is optimized by adjusting the variable capacitors 1A2C32 through 1A2C39.

3-22. POWER DISTRIBUTION.

3-23. GENERAL. Refer to the AC power distribution, figure 5-2 for the following discussion. The antenna coupler is designed for primary power operation of 94.5 to 137.5 volts ac, 189 to 275 volts ac, 47.5 to 63 Hz single phase. The cross connections on transformer 1A3T1 primary determines the primary power line voltage required. Section 8, paragraph 9, lists the cross connections and voltages. The antenna coupler is factory wired for 103.5 to 126.5 volt operation.

3-24. The ac power is applied to the antenna coupler through cable assembly 1W2 to ac jack 1J1. The front panel POWER ON-OFF toggle switch 1S1 controls the application of power. In the ON position of switch 1S1 the red indicator lamp 1DS1 lights. Fuses 1F1 and 1F2 are 1 AMP Slo-Blo fuses that protect the antenna coupler. Filters 1FL1 and 1FL2 are used to prevent rf interference from entering the antenna coupler from the primary power lines. The primary power is applied from the filters to the primary of transformer 1A3T1 where it is stepped down to approximately 33.5 volts ac (nom.) at the secondary. The remainder of the power supply provides regulation and filtering to obtain the +23.5 volts dc regulated.

3-25. POWER SUPPLY, 1A3, PN 34-0187. The power supply, figure 5-10, provides the +23.5 volts dc regulated voltage for the divider assembly 1A2. The divider assembly requires 800 milliamperes of current. The power supply is current limited at approximately one ampere. The dc output terminal at jack 1J1 pin A can be shorted without causing damage to the power supply circuits or opening fuses 1F1 or 1F2. The power supply 1A3 contains a printed circuit card that houses the regulator assembly 1A3A1 components. The transformer 1A3T1 secondary terminals 9 and 10 are connected to a full wave bridge rectifier with a two ampere rating consisting of 1A3A1CR1 through 1A3A1CR4. Capacitor 1A3C1 filters the bridge output voltage. Zener diodes 1A3A1CR5 throught 1A3A1CR7 and the bleeder resistor 1A3A1R1 set a reference voltage of 27.3 volts dc. Voltage regulator transistor 1A3A1Q1 with its operating voltages set by resistors 1A3A1R3 through 1A3A1R5 and 1A3A1R12 buffers the reference voltage and provides base

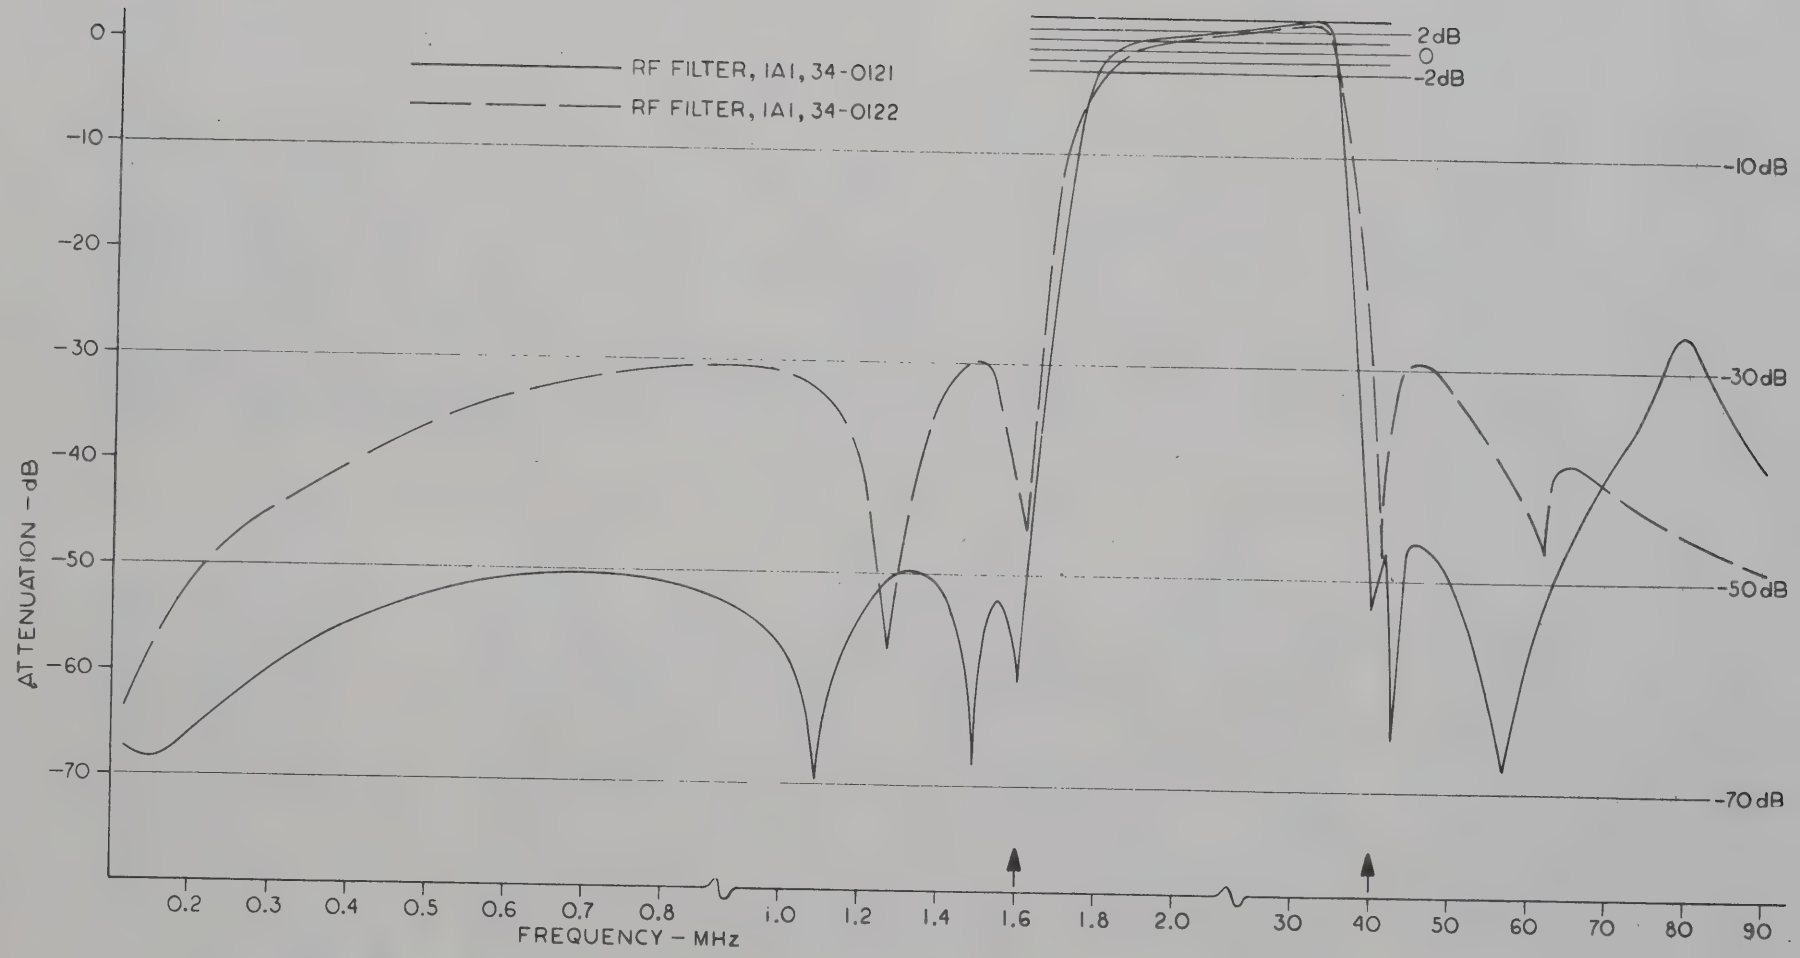

Figure 3-2. Attenuation versus Frequency

drive for 1A3Q1 and 1A3Q2. DC amplifier 1A3A1Q2 is biased by resistor 1A3A1R6. The two series pass transistors 1A3Q1 and 1A3Q2 provide the regulated 23.5 volts dc from the unregulated 40 volts dc output of the bridge rectifier. The current limit sensing transistor 1A3A1Q3 is controlled by the voltage drop across resistors 1A3A1R7 and 1A3A1R8. Transistor 1A3A1Q3 conducts as a direct function of the voltage drop across resistors 1A3A1R7 and 1A3A1R8. This causes the base voltage of transistor 1A3A1Q2 to decrease, which in turn causes the series pass transistor 1A3Q1 and 1A3Q2 to reduce the +23.5 volts dc output voltage. A voltage divider formed by 1A3A1R9 and 1A3A1R10 averages the voltage differences applied to the base transistor 1A3Q1Q3. The difference in emitter voltage at 1A3Q1 and 1A3Q2 are caused by the dc beta spread of these transistors. The noise generated by the bridge rectifies 1A3A1CR1 through 1A3A1CR4 and the Zener diode 1A3A1CR5 through 1A3A1CR7 is filtered by capacitors 1A3A1C1 and 1A3A1C2. Capacitor 1A3A1C3 filters the dc output.

CHAPTER 4

SCHEDULED MAINTENANCE

4-1. INTRODUCTION.

4-2. This chapter contains the step-by-step procedure to verify that the antenna couplers are operating satisfactorily. Performance testing is to be accomplished on a semiannual basis. No preventive maintenance is required for the antenna couplers.

4-3. SCHEDULED PERFORMANCE TEST.

4-4. PROCEDURE. Table 4-1 contains the detailed procedure for accomplishing the semiannual performance tests. The title and description of the test, safety precautions, the minimum rating of the technician expected to perform the test, preliminary procedures, and reference to troubleshooting or corrective actions are given with each of the detailed maintenance test procedures. It is recommended that each test procedure be read through to its completion before the test begun.

4-5. SAFETY PRECAUTIONS. The attention of officers and operating personnel is directed to Chapter 67 of the Bureau of Ships Manual or superseding instruction on the subject of Electronic Safety precautions to be observed. While every practicable safety precaution has been incorporated into this equipment, the rules in the following paragraphs must be strictly observed.

WARNING

Failure to comply with the instructions in the following paragraphs may result in severe electrical shock. Maintenance personnel must at all time observe all safety regulations.

4-6. Make sure you are not grounded whenever making measurements or adjustments. For example, hand rails, exposed metal decks, or equipment frames may provide inadvertent ground contacts.

4-7. Ground the case of test equipment whenever possible, and before starting measurements where test equipment must be held or adjusted during the measurements.

4-8. To avoid casualties, always remove power from set and connect a ground first. Under certain conditions, dangerous potentials may exist in circuits with power controls in the off position, due to charges retained by capacitors.

4-9. Be carefull even when measuring low voltages. Do not forget that high voltages may be present across terminals which are normally low voltage.

Table 4-1. Semiannual Scheduled Performance Test

TEST NO.	REFERENCES AND PROCEDURES
S1	Check rf Output Gain DESCRIPTION: Measure rf output signal gain at each of the eight output connectors. SAFETY PRECAUTIONS: Observe standard safety precautions (refer to paragraph 4-5). MINIMUM TECHNICAL RATING REQUIRED FOR TEST: ET3 TOOL AND EQUIPMENT REQUIRED: Rf Signal Generator CAQ1-606B Oscilloscope AN/USM-281 PRELIMINARY SETUP: 1. Connect signal generator and oscilloscope to power source and turn ON; allow a 10-minute warmup. 2. Disconnect antenna coupler input. 3. Adjust signal generator output to -2 dBm at 2 MHz. 4. Connect test cable between signal generator rf output and oscilloscope vertical input. The scope must be terminated with 50 ohms. 5. Adjust oscilloscope verticle gain for a 3 centimeter display. 6. Disconnect test cable from oscilloscope and connect to the input jack J2 of antenna coupler. 7. Disconnect all antenna coupler outputs. TEST PROCEDURE: 1. Connect test cable between oscilloscope vertical input (terminated) and output jack 1A2J 10(1) of antenna coupler. 2. Adjust attenuator on signal generator for 3 centimeter vertical display on oscilloscope.

Table 4-1. Semiannual Scheduled Performance Test (Cont)

	3. Note gain in dBm at signal generator. Gain should be between 1 and 5 dBm. 4. Repeat steps 1 through 3 for: OUTPUT — JACK 2 — 1A2J9 3 — 1A2J8 4 — 1A2J7 5 — 1A2J6 6 — 1A2J5 7 — 1A2J4 8 — 1A2J3 TROUBLESHOOTING REFERENCE: Figure 5-1.

CHAPTER 5

TROUBLESHOOTING

5-1. INTRODUCTION.

5-2. This chapter contains data, procedures and diagrams to aid the maintenance technician in identifying and analyzing malfunctions, localizing troubles to the malfunctioning assembly and isolating faults to a stage or circuit within that assembly. A procedure is provided which gives instructions for initial checks and test setups. From this procedure, overall equipment operability can be ascertained and inoperative functions can be identified. Signal flow diagrams provided for each equipment function, together with an overall antenna coupler troubleshooting procedure, serve to localize trouble to the malfunctioning assembly. Fault logic diagrams are provided to help identify faulty circuits. Schematic diagrams and troubleshooting tables are provided for troubleshooting the suspect assemblies and circuits independently.

5-3. TROUBLESHOOTING INDEX.

5-4. Table 5-1 lists the antenna coupler functional areas in alphabetical order and cross-references the appropriate paragraphs and illustrations to be used in trouble analysis of each faulty function.

5-5. RELAY AND LAMP INDEX.

5-6. Table 5-2 provides the maintenance technician with the item reference designation, functional name, energizing voltage, and a reference to the troubleshooting diagram for each coupler relay and lamp.

5-7. PROTECTIVE DEVICES INDEX.

5-8. Table 5-3 lists all antenna coupler protective devices in alphanumerical sequence according to reference designation, with the front panel markings of each device given in the adjacent column. In addition, the electrical rating of the device, and a reference to the applicable troubleshooting diagram are provided in adjacent columns.

5-9. MAINTENANCE TURNON PROCEDURE.

5-10. The antenna coupler maintenance turnon procedure given in table 5-4 energizes the coupler. Apply input power to the electronic test equipments below or equivalent, and allow a 30-minute warm-up period before beginning turnon:

Multimeter AN/USM-311
R-f Generator CAQI-606-B
R-f Voltmeter 04901-91H-57

5-11. TROUBLESHOOTING PROCEDURES.

5-12. The r-f filter 1A1 is a nonrepairable item due to its inherent reliability. The filter will not degrade during operation over very long periods. Should the filter be mechanically damaged, replace with a spare unit. All other modules (3) are repairable on a component replacement basis.

5-13. TROUBLESHOOTING DIAGRAMS.

5-14. GENERAL. The troubleshooting diagrams included in this chapter consist of signal flow diagrams, power distribution diagrams, a control diagram, fault logic diagrams, and maintenance diagrams. These diagrams aid the technician in troubleshooting by enabling consecutive narrowing down of a fault to a specific component.

5-15. SIGNAL FLOW DIAGRAM. Signal flow diagram provided for each major equipment function are the main troubleshooting tool. These diagrams show signal paths, connectors, test points, terminals, adjustments, indicators, and circuit stages - the information necessary to isolate a malfunctioning circuit quickly.

5-16. Included with the signal flow diagram are the test data required to obtain the measurements to be made at various points on the diagram. The data include test equipment required, reference to other areas of the manual which may furnish additional information, preliminary setup instructions, and a number of test steps which give step-by-step procedures for obtaining the indication shown at each of the test points indicated on the signal flow diagram.

5-17. The rf filter (1A1) and divider assembly (1A2) require sources and loads of 50 ohms during testing as individual modules. If rf voltage outputs are higher than specified, check to insure that proper loads are used.

NOTE

The 8 output ports of the divider assembly may be operated without 50 ohm terminations if desired, without significantly altering the specified performance.

NOTE

Reference is made to both the CU-1382F/FRR and CU-1382G/FRR. These two units are identical, electrically and mechanically, with the exception of the rf filter (1A1) and the divider (1A2). Where different, the instructions cover each unit individually. The rf filter design for the CU-1382G/FRR provides for phase tracking between outputs of the coupler and for phase tracking between CU-1382G/FRR coupler - the CU-1382F/FRR is not a phase tracking coupler. The divider assembly (1A2) for the CU-1382G/FRR has eight added capacitors to adjust the phase tracking, otherwise it is identical to the CU-1382F/FRR divider assembly.

5-18. AC POWER DISTRIBUTION DIAGRAM. The power distribution diagram (figure 5-2) aids in troubleshooting the circuits involved in primary power. This diagram depicts the distribution of each voltage from its source to the subassembly (1A2).

5-19. FAULT LOGIC DIAGRAMS. Supplementing each signal flow diagram is a fault logic diagram (figures 5-3 and 5-4), which provides a logical troubleshooting procedure with normal values at each test point.

5-20. MAINTENANCE SCHEMATIC DIAGRAMS. Maintenance schematic diagrams are provided for the overall coupler (figure 5-5) and for each of the sub-assemblies (figure 5-6 through 5-10).

Table 5-4. Antenna Coupler 1382F/FRR and 1382G/FRR, Maintenance Turnon Procedure

STEP	OBSERVE	REFERENCE
1. Preliminary procedure	NOTE Perform the preliminary procedure before applying power to the antenna coupler.	
a. Loosen cover screws and remove cover.		
b. Momentarily remove fuses 1F1 and 1F2 and check for proper value. Reinsert fuses.		AC power distribution, figure 5-2.
c. Visually check for any positive indication of electrical or mechanical failures. Insure that all cables and wires are in place and that assemblies are firmly mounted to the chassis.		
2. Overall AC and DC voltage application.		Power Distribution Fault Logic Diagram, figure 5-4.
a. At rear of case, apply 115 Vac to connector 1W2P1.		
b. On front panel, remove fuses 1F1 and 1F2 and replace the fuse caps.		
c. Turn power switch 1S1 to ON.	Fuse indicator for 1F1 and 1F2 illuminate.	Schematic figure 5-5.

Table 5-4. Antenna Coupler 1382F/FRR and 1382G/FRR, Maintenance Turnon Procedure (Cont)

STEP	OBSERVE	REFERENCE
2. Overall AC and DC voltage application (Cont)		
d. Return power switch 1S1 to OFF. Reinstall fuses 1F1 and 1F2 and replace indicator caps.		
e. Turn power switch 1S1 to ON.	Fuse indicators do not illuminate. Lamp 1DS1 illuminates on front panel indicating that 115 Vac is now applied to coupler Power Supply Assembly 1A3.	Schematic figure 5-5.
f. On coupler divider assembly 1A2, locate jack 1A2J1 on the right rear corner of the divider assembly.		
g. Connect Multimeter, AN/USM-311 between 1A2J1 (+) and chassis (-) and observe multimeter.	23.5 Vdc $\pm$ 0.5 Vdc. If greater than 24.0 Vdc or less than 23.0 Vdc, immediately turn power switch 1S1 to OFF and troubleshoot Power Supply Assembly 1A3.	Schematic figure 5-5, 5-10.
3. RF filter check, 1A1		
a. Connect rf Generator, CAQI-606-B to INPUT jack 1J2 and set its output to 0.25 volts at 2.0 MHz.		Fault logic diagram, figure 5-3. Schematic figure 5-6 (CU-1382F/FRR) or figure 5-7 (CU-1382G/FRR) RF Signal Flow Diagram, figure 5-1.

Table 5-4. Antenna Coupler 1382F/FRR and 1382G/FRR, Maintenance Turnon Procedure (Cont)

STEP	OBSERVE	PROCEDURE
3. RF filter check, 1A1 (Cont)		
b. Using rf voltmeter 04901-91H-S7, measure rf voltage at rf filter 1A1J1.	0.25V rf If voltage is low inspect cable and connectors for damage.	
c. Measure rf signal voltage at rf filter 1A1J2	0-285mv rf If low, replace rf filter 1A1.	
4. Divider Assembly 1A2	- - - - - CAUTION - - - - -	Heatsink Removal, figure 5-11.
If heatsink must be removed from divider assembly, study figure 5-11 carefully. Remove 9 screws in row near center of heatsink first, then remove the two screws at rear of heatsink. This frees all transistors from the heatsink. Remove the four screws at the outside corners of the large section of the heatsink, then gently lift off.		
	- - - - - CAUTION - - - - -	
Power must not be on for more than 2 minutes at a time when heatsink is removed. Allow 5 minutes cooling between power applications. Excessive heat will damage transistors.		
a. With rf generator connected to INPUT jack as in step 3, measure rf voltage at input to Divider Assembly 1A2J1.	0.285V rf If low inspect input cables and connectors for damage.	RF Fault Logic Diagram, figure 5-3. Schematic, figure 5-8 (CU-1382F/FRR) Schematic, figure 5-9 (CU-1382G/FRR) RF Signal Flow Diagram, figure 5-1

Table 5-4. Antenna Coupler 1382F/FRR and 1382G/FRR, Maintenance Turnon Procedure (Cont)

STEP	OBSERVE	REFERENCE
4. Divider Assembly, 1A2 (Cont)		
b. Move rf voltmeter to OUTPUT 1, 1A2J10, with 50 ohm load on meter input.	0.29V rf nominal	
c. Repeat measurement for outputs 2 through 8, 1A2J9 through 1A2J3.	0.29V rf nominal If any output measures below 0.28V rf or higher than 0.35V rf, trouble-shoot the divider assembly 1A2.	

TEST DATA FOR FIGURE 5-1

GENERAL

A. Test Equipment Required:
RF Generator CAQI-606-B
RF Voltmeter 04901-91H-S7
Multimeter AN/USM-311

B. References: If necessary, make the following references:
Functional Description, paragraph 3-9
Troubleshooting Sequence, figure 5-3
Heatsink Removal, figure 5-11

C. Relay 1A2K1 shown in unenergized state.

D. 1E1 is a gas-filled surge voltage protector.

E. Preliminary Setup: Set antenna coupler POWER ON-OFF switch 1S1 in the ON position.

F. Test Setup: Connect rf signal generator to INPUT jack 1J2 and set its output for 2 MHz at 0.25V rms.

SPECIFIC

Test Setups:

TS-1	Refer to notes E and F before performing test. Using rf voltmeter measure rf input voltage to rf filter 1A1 from INPUT jack 1J2 as indicated at 1A1J1.
TS-2	Using rf voltmeter, measure rf signal voltage from rf filter 1A1 to divider assembly 1A2 as indicated at 1A1J2.
TS-3	Using rf voltmeter, measure rf signal as indicated at 1A2K1, and using multimeter, measure 10.5 volts dc at collector of 1A3Q3.
TS-4	Using rf voltmeter, measure rf signal voltage from transformer 1A2T1 to the bases of emitter followers 1A2Q1 and 1A2Q2 as indicated.
TS-5	Using rf voltmeter, measure rf signal voltage as indicated at emitters of emitter followers 1A2Q1 and 1A2Q2.
TS-6	Using rf voltmeter, measure rf signal voltage as indicated at emitters of emitter followers 1A2Q4 and 1A2Q11.
TS-7	Measure rf signal at 1A2J3 through 1A2J10, voltage level as indicated.

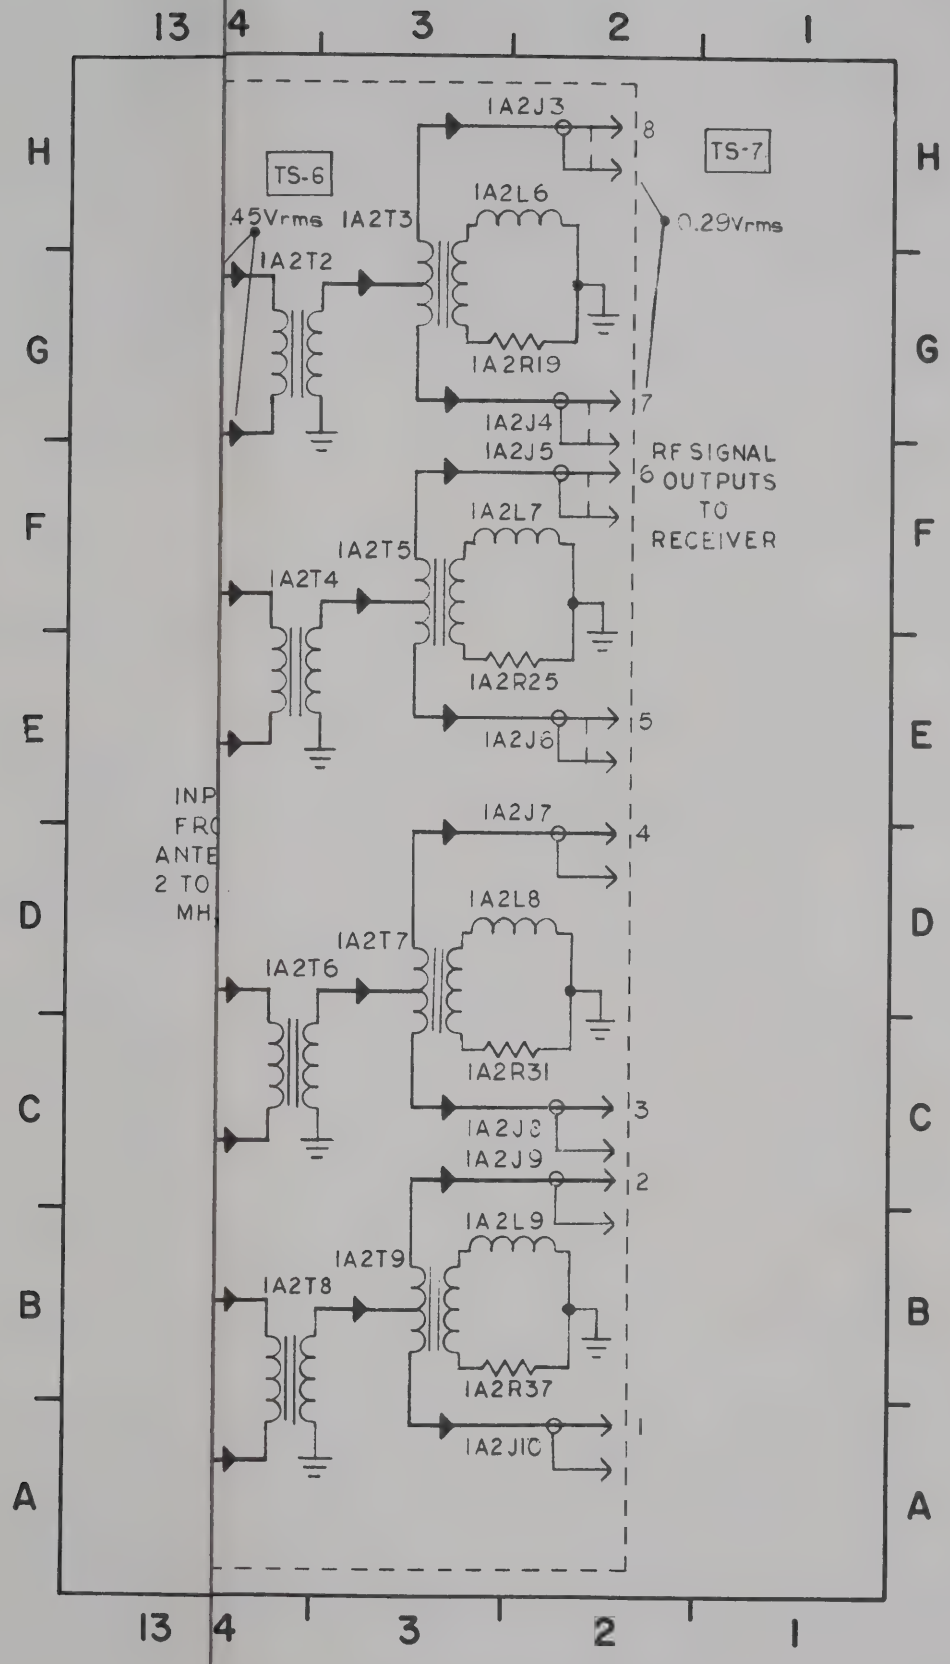

Figure 5-1. RF Signal Flow Diagram

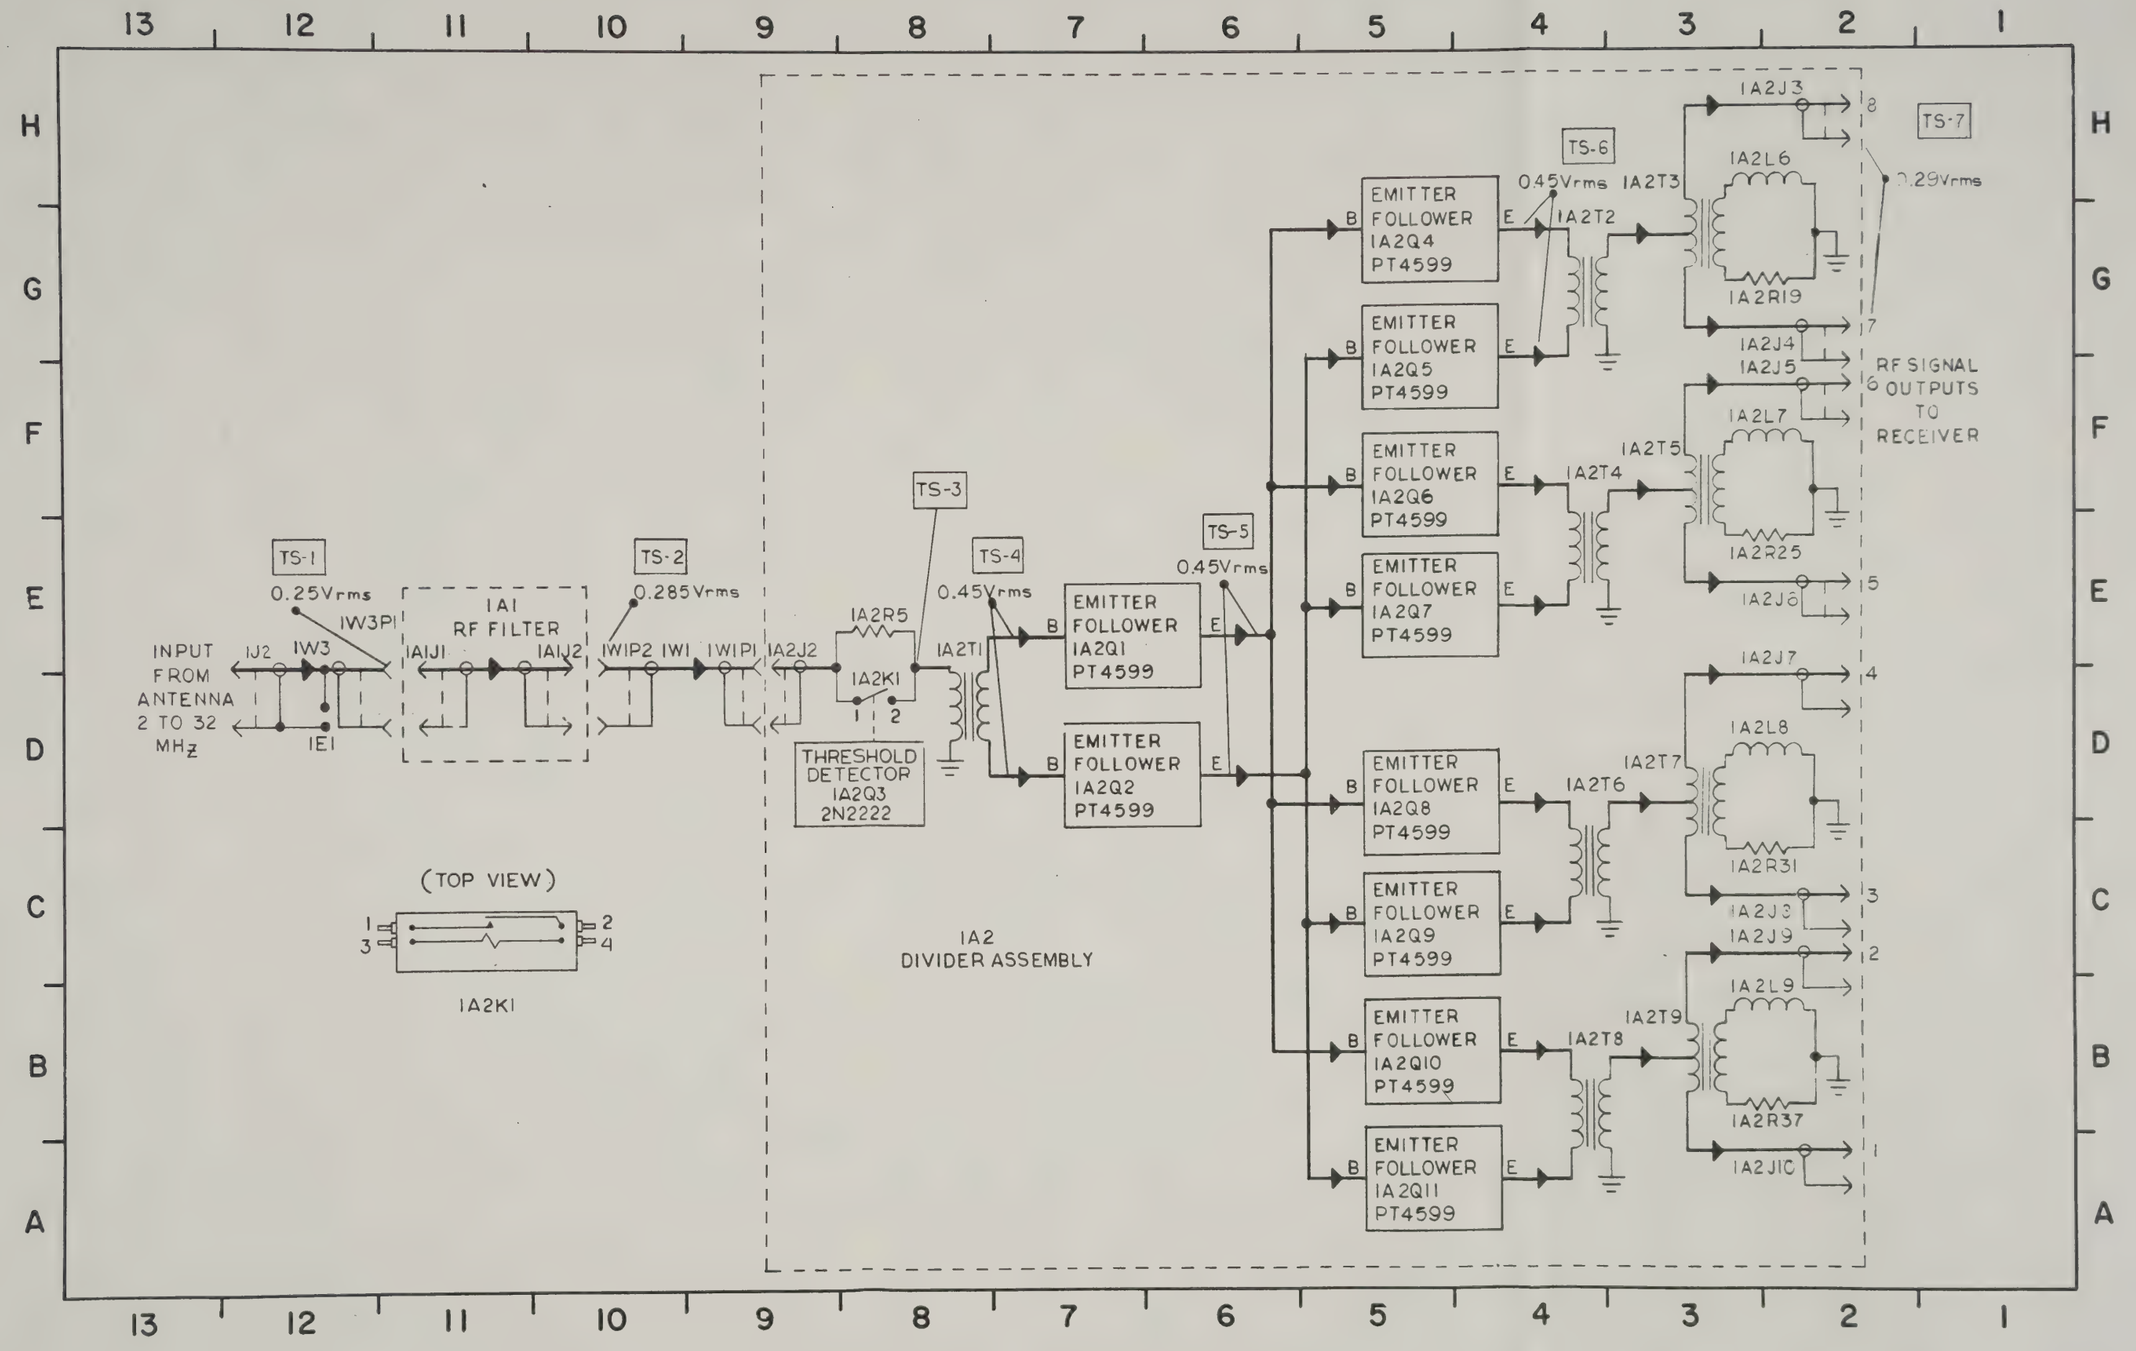

Figure 5-1. RF Signal Flow Diagram

TEST DATA FOR FIGURE 5-2

GENERAL

A. Test Equipment Required:
Multimeter AN/USM-311

B. References: If necessary, make the following references:
Function Description, paragraph 3-22
Troubleshooting Sequence, figure 5-4
Physical Location of Test Points, figure 7-6

C. Preliminary Setup. Set antenna coupler POWER ON-OFF switch in the ON position.

SPECIFIC

Test Setups:

TS-1 Refer to note C before performing test.

NOTE

The antenna coupler may be wired for other than 115 volts operation. Refer to Chapter 8 for the nominal voltages at TS-1 and TS-2.

Using multimeter measure ac input voltage from power cable assembly to ac line filters 1FL1 and 1FL2 as indicated across lamp 1DS1.

TS-2 Using multimeter measure ac voltage at output of line filters 1FL1 and 1FL2 as indicated.

TS-3 Using multimeter measure ac voltage at secondary of transformer 1A3T1 as indicated.

TS-4 Using multimeter measure rectified dc voltage at output of full wave bridge rectifier junction of 1A3CR1 and 1A3CR3 (TERM 10) as indicated.

TS-5 Using multimeter measure dc voltage at base of voltage regulator 1A3A1Q1 as indicated.

TS-6 Using multimeter measure dc voltage at emitter of voltage regulator 1A3A1Q1 (TERM 5) as indicated.

TS-7 Using multimeter, measure dc voltage at emitter of dc amplifier 1A3A1Q2 (TERM 6) as indicated.

TS-8 Using multimeter measure dc voltage at emitter of output amplifier 1A3Q1 (TERM 1) or 1A3Q2 (TERM 2) as indicated.

TS-9 Using multimeter measure dc voltage at emitter of sensing amplifier 1A3A1Q3 (TERM 3) as indicated.

NOTES FOR FIGURE 5-11

GENERAL NOTES

A. EXPLODED VIEW APPLICABLE TO BOTH DIVIDER ASSEMBLIES, 1A2, PART NUMBER 34-0086-1 USED ON CU-1382F/FRR AND PART NUMBER 34-0086-2 USED ON CU-1382G/FRR.

B. REMOVE HEATSINK AS FOLLOWS:

1. REMOVE 5 HEATSINK RETAINING SCREWS ON EACH END OF HEATSINK.

2. REMOVE 10 SCREWS, LOCK WASHERS AND FLAT WASHERS SECURING WAKEFIELD CLIPON HEATSINKS.

NOTE

IF TRANSISTORS MUST BE REMOVED, REMOVE WITH WAKEFIELD HEATSINK ATTACHED. WHEN REPLACING HEATSINK, USE SCREWS PROVIDED OR SCREWS NOT EXCEEDING 1/2 INCH IN LENGTH. REPLACE ALL SCREWS.

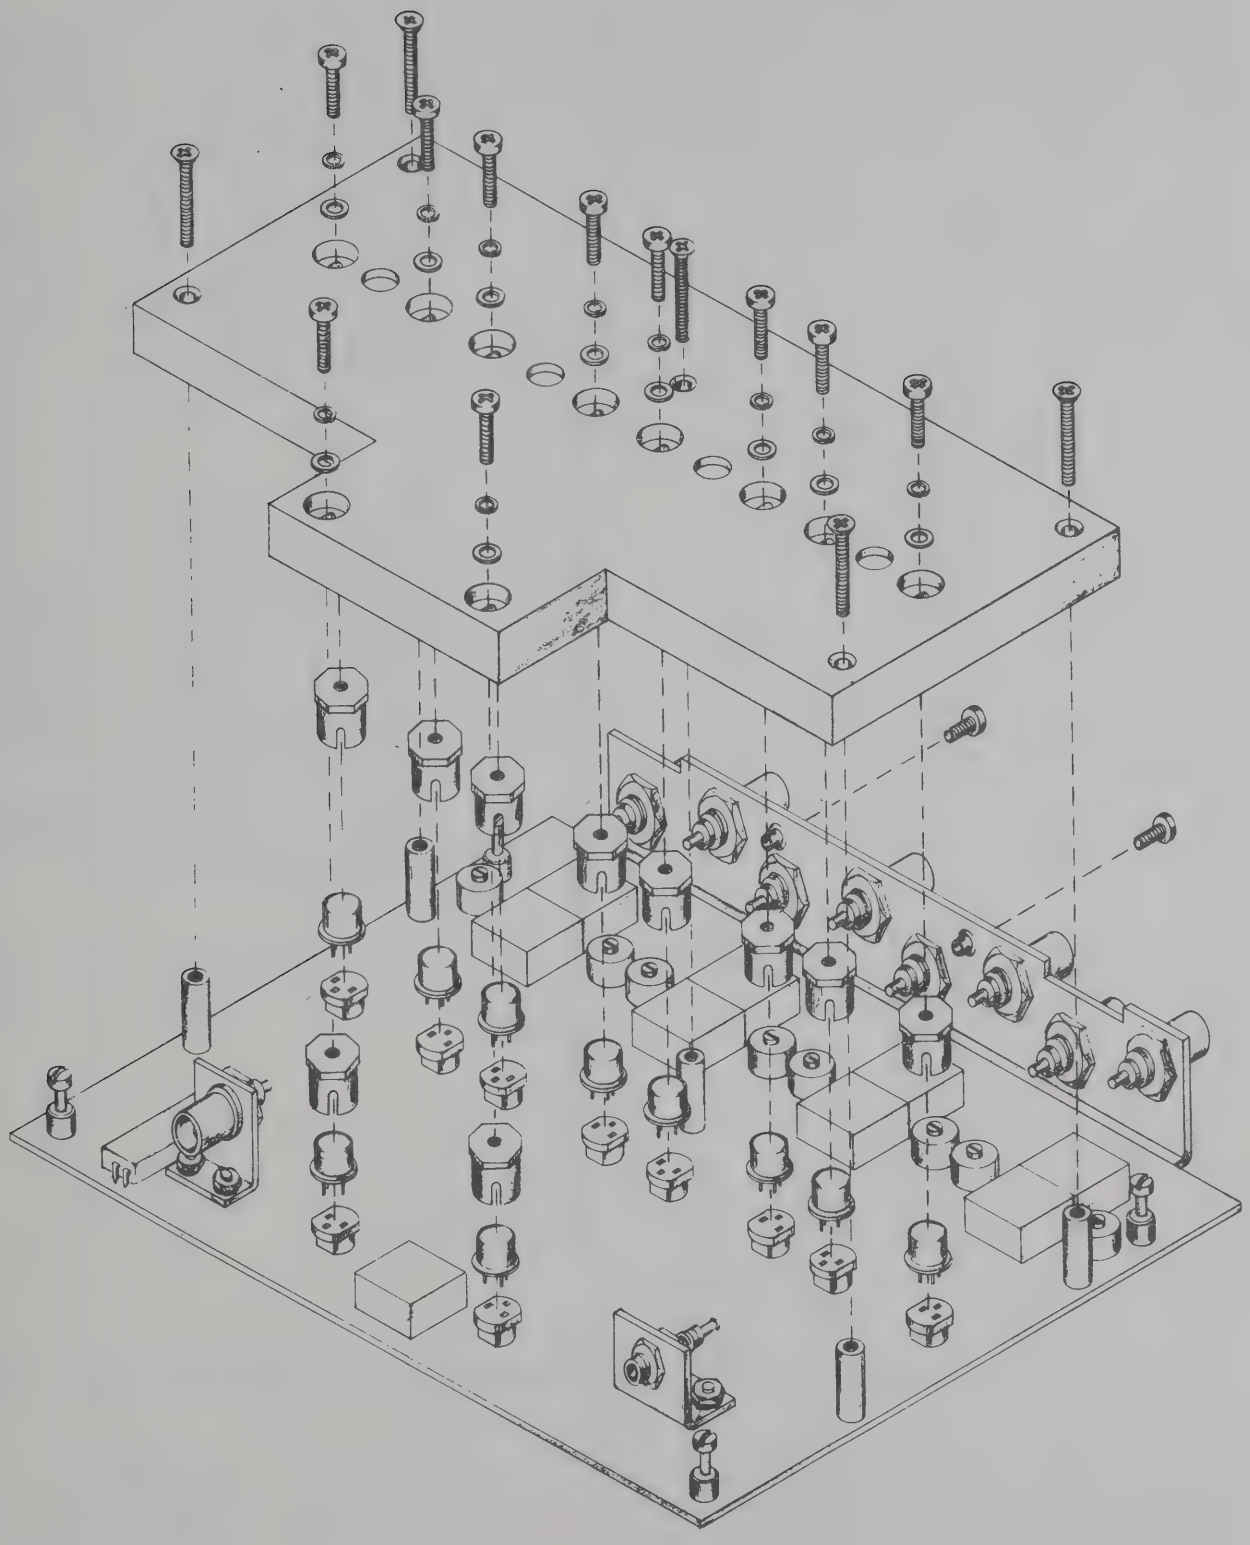

Figure 5-11. Heatsink Removal

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
		NOTE The following comprehensive tests are included for complete testing of the antenna coupler. These tests are included for reference purposes.		
1. Gain/Gain Tracking	Network Analyzer Hewlett-Packard 675A/676A Oscilloscope	NOTE Gain is to be measured at frequencies 2.0 MHz, 17.0 MHz and 28 MHz with the antenna coupler input filter installed. Gain at 0.3 MHz is to be measured with the antenna coupler input filter by-passed. a. Connect test equipment as shown in figure 5-12. b. Set sweep generator output for -10 dBm, 1-32 MHz. c. Calibrate equipment for 1 dB/centimeter on oscilloscope. d. Terminate all unused outputs of the antenna coupler with 50 ohm loads.	2.0 dB $\pm$ 1.0 dB with filter installed 2.0 dB $\pm$ 1.0 dB with filter bypassed Tracking within $\pm$ 0.5 dB	

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
1. Gain/Gain Tracking (Cont)		e. Measure gain at antenna coupler outputs 1 through 8 at frequencies of 2.0 MHz, 17 MHz and 28 MHz. f. Disconnect coax cable at the input of the 1:8 divider. Disconnect coax cable at the input of the antenna coupler filter and connect it to the input of the 1:8 divider. g. Measure gain at antenna coupler outputs 1 through 8 at 0.3 MHz. h. Determine that gain of each output tracks within ± 0.5 dB tracking at each frequency. i. Reconnect antenna coupler filter.	± 0.5 dB tracking	

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
2. Noise Figure	Noise Generator Aero Space Research Inc. Model NS-6 (or equivalent) Low Noise Post Amplifier 20 dB gain minimum Noise and Field Intensity Meter Empire Devices NF-105 (or equivalent) Variable attenuator 28480-355C RF Voltmeter 04901-91H-S7 (or equivalent)	Initial test conditions: a. Terminate unused ports in 50 ohms. b. Connect rf filter. a. Disconnect antenna coupler from the test setup. Connect the output of the noise generator directly into the post amplifier. b. Turn the noise generator output to minimum (two knobs) and obtain a convenient reference level on the rf voltmeter with the receiver tuned to F1 the lowest frequency of interest (see test data sheet, figure 5-15, rf gain max, agc off, rf attenuation min., output preselector set to WB, mode switch to am, if bw to 6 kc, and second vfo to int. c. Insert 3 dB attenuation in the adjustable pad (from 0 dB attenuation) and increase the noise generator output to the		5-14 5-15

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
2. Noise Figure (Cont)		same reference level previously obtained. Read noise figure directly from the noise generator front panel meter and record on the data sheet in the column designated receiver noise figure. d. Repeat steps 2 and 3 at each of the frequencies indicated on test data sheet by tuning the receiver to these frequencies. e. Connect antenna coupler into test setup as shown in figure 5-14. Repeat steps 2, 3 and 4 filling in the noise figure column labelled combination noise figure. Remove the rf filter when making measurements below 2 MHz. f. Fill in data sheet column labelled antenna coupler gain using data obtained in the gain test of paragraph 9.0 and previously recorded on the data sheets.		

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
2. Noise Figure (Cont)		g. Compute antenna coupler noise figure using the following formula: $F_a = F_{ab} - \frac{F_b - 1}{G_a}$ $F_a(dB) = 10 \log_{10}[F_{ab} - \frac{F_b - 1}{G_a}]$ F_{ab} = Noise Figure of the combination in dB F_a = Noise Figure of antenna coupler expressed as a power ratio F_b = Noise Figure of post amp expressed as a power ratio G_a = Available power gain of the antenna coupler Place the computed antenna coupler noise figure numbers in the proper column on the data sheet.

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
3. Intermodulation Test	RF Signal Generator CAQ1-606-B (or equivalent) NOTE: 2 required RF Voltmeter 04901-91H-S7 (or equivalent) Noise and Field Intensity Meter NF-105 (or equivalent) Power Combiner Adjustable Pad 0-120 dB 28480-355D 50 ohm termination	NOTE Refer to figure 5-16 for frequencies to be used for this test. a. Connect test equipment as shown in figure 5-17. b. Tune generator #1 to frequency f1 and generator #2 to f2. c. Disconnect generator #2 from power combiner. Terminate the power combiner with 50 ohms. d. Adjust generator #1 for 0.5 rms (measure with RF VTVM at the input of the antenna coupler. e. Adjust generator #2 to the power divider. Disconnect generator #1 from power combiner and terminate the combiner with 50 ohms. f. Adjust generator #2 for 0.5 vrms (measured with RF VTVM at the input of the antenna coupler.	-65 dB in-band -55 dB out-band	

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMFNT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
3. Intermodulation Test (Cont)		g. Reconnect generator #1 to the power combiner. Disconnect RF VTVM from input of antenna coupler. h. Tune the receiver to the frequency f3, (f1 $\pm$ f2 or 2 f1 $\pm$ f2). Decrease the attenuation of the variable attenuator as required to obtain a usable signal on the signal strength meter. i. Disconnect the variable attenuator from the output of the antenna coupler and connect generator #3 to the variable attenuator pad. j. Tune generator #3 to the frequency f3 of the receiver as previously set in procedure 8. NOTE: Tuning generator #3 to f3 may be accomplished by a combination of generator output voltage and step pad attenuation that will produce a convenient level on the signal strength meter. k. Adjust variable attenuator for 100 dB attenuation.		

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
3. Intermodulation Test (Cont)		1. Disconnect generator #3 from the adjustable attenuator and set the generator output level for 0.5 vrms as measured with an RF VTVM into a 50 ohm load. m. Reconnect generator #3 to the variable attenuator. n. Adjust receiver input attenuator for 20 dB of attenuation and set a convenient reference level on the signal strength meter. NOTE: This is the 0 dB reference point for the frequencies f1 and f2. o. Disconnect generator #3 and reconnect the antenna coupler output to the variable attenuator. p. Decrease the attenuation of the variable attenuator until the signal strength meter indicates the same level as obtained in procedure 14. NOTE: The amount of attenuation removed from the variable attenuator is the level of the intermodulation product (in dB) below 0.5 volts.		

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
3. Intermodulation Test (Cont)		q. Repeat procedure 2 through 16 for other frequencies as tabulated in table r. Bypass antenna coupler input filter and repeat procedures 2 through 16 as required for frequencies noted in table		

Table 5-5. Performance Tests for CU-1382F/FRR and CU-1382G/FRR (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
4. Input and Output VSWR	Network Analyzer Hewlett-Packard 675A/676A Oscilloscope AN/USM-281 (or equivalent) Directional Bridge Hewlett-Packard 8721A (or equivalent)	Connect equipment as shown in figure 5-18. Set frequency range of sweep generator to 1-32 MHz with rf output level of -10 dBm. Calibrate equipment for 10 dB per centimeter on the oscilloscope. Adjust a reference level on the oscilloscope with the Directional Bridge load open or disconnected. Terminate all unused outputs or input of antenna coupler with 50 ohm load. Measure input or output vswr by connecting load of directional bridge to the antenna coupler input or outputs. (Refer to chart to determine vswr, i.e., -14 dB = 1.5:1)

CHAPTER 6

CORRECTIVE MAINTENANCE

6-1. INTRODUCTION.

6-2. This chapter contains all instructions required to align and adjust the CU-1382F/FRR and CU-1382G/FRR and its subassemblies, and to remove, repair, and test repairable subassemblies. This chapter is divided into two sections. Section I contains information and procedures for alignment and adjustment of electronic circuits and mechanical assemblies; Section II contains repair instructions, which cover disassembly, means of access, parts removal, and complex repair actions.

6-3. GENERAL.

6-4. This section contains all information and procedures required to perform all necessary alignments and adjustments of the CU-1382F/FRR and CU-1382G/FRR at station and depot level. Included are alignment and adjustment procedures for electronic assemblies. Test equipment setup drawings are provided where necessary to support the procedures.

6-5. ELECTRONIC ALIGNMENTS AND ADJUSTMENTS.

6-6. PROCEDURES. Overall alignment and adjustment procedures for the CU-1382F/FRR and CU-1382G/FRR are given in table 6-1; procedures for the individual assemblies and subassemblies within the multicoupler are also given in table 6-1.

6-7. Each alignment and adjustment table gives the test equipment requirements, step-by-step procedures, adjustment values, and references to supporting illustrations showing the necessary test setups.

6-8. SAFETY PRECAUTIONS. Observe all standard safety precautions whenever performing any of the alignments and adjustments in this section. Refer to paragraph 4-5.

6-9. TEST EQUIPMENT REQUIRED. All alignment and adjustment procedures in this chapter use the approved test equipments listed in table 1-4.

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
1. Preliminary Procedure		a. Set power switch 1S1 to OFF. b. Loosen cover screws and remove cover.		
2. Power supply check	Multimeter AN/USM-311 (or equivalent)	a. Connect multimeter between terminal 1A3J1 (+) and chassis (-). b. Set power switch 1S1 to ON. c. Check that multimeter indicates 23.5 volts ± 0.5 volts. - - - - - CAUTION - - - - - If multimeter indicates higher than 24 volts or less than 23.0 volts, return power switch to OFF and troubleshoot the power supply.		
3. Isolation Output/Output	Network Analyzer HP675A/676A Oscilloscope AN/USM-281 (or equivalent)	NOTE Remove heatsink. - - - - - CAUTION - - - - - Consecutive operating time for multicouplers without heatsinks shall not exceed two minutes.		

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
		a. Connect test equipment as shown in figure 6-1.		
		b. Set sweep generator output for -10 dBm, 1-32 MHz.		
		c. Calibrate equipment for 10 dB/centimeter on oscilloscope.	-40 dB min.	
		d. Terminate input and all unused outputs of the antenna coupler with 50 ohm loads.		
		e. With cables "A" and "B" connected to antenna coupler output 1 and 2, adjust variable capacitor C23 for maximum isolation across 2-32 MHz band.	-40 dB min.	
		f. Disconnect cables "A" and "B" from antenna coupler and connect to outputs 3 and 4. Adjust C21 for maximum isolation.	-40 dB min.	
		g. Disconnect cables "A" and "B" from antenna coupler and connect to outputs 5 and 6. Adjust C19 for maximum isolation.	-40 dB min.	

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
		h. Disconnect cables "A" and "B" from antenna coupler and connect to outputs 7 and 8. Adjust C17 for maximum isolation.	-40 dB min.	
		i. Disconnect cables "A" and "B" from antenna coupler and test all combinations of antenna coupler outputs for isolation. In the event any two or more outputs are not -40 dB or better, repeat procedures 5 through 9.	-40 dB min.	

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
4. Phase Correlation Adjustment	Network Analyzer Hewlett-Packard 675A/676A Oscilloscope AN/USM-281 (or equivalent)	NOTE This procedure is to be used only when checking or adjusting phase tracking between the 8 outputs of a single antenna coupler. If it is desired to check or adjust phase tracking against another antenna coupler or standard, refer to procedure 5. NOTE Multicouplers and test equipment must be operating for 4 hours prior to performing this adjustment. a. Calibrate test equipment and connect cables "A" and "B" to the antenna coupler outputs 1 and 8 as shown in figure 6-2. Set sweep generator for -10 dBm output, 1-32 MHz. b. Adjust variable capacitor C39 to its mid-range position. c. Adjust variable capacitor C32 for minimum phase shift difference.	± 2.0 degrees	

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
4. Phase Correlation Adjustment (Cont)		d. In the event capacitor C32 cannot be adjusted within ± 2 degrees, readjust C39 slightly from its preset position and adjust C32. e. Repeat procedures 2-4 as necessary until phase shift is within ± 2.0 degrees. f. Disconnect cable "B" and connect it to antenna coupler output #7. Adjust C33 for minimum phase shift difference. g. Disconnect cable "B" and connect to antenna coupler output #6, and adjust C34 for minimum phase shift difference. h. Disconnect cable "B" and connect to antenna coupler output #5 and adjust C35 for minimum phase shift difference. i. Disconnect cable "B" and connect to antenna coupler output #4, and adjust C36 for minimum phase shift difference.		

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
4. Phase Correlation Adjustment (Cont)		j. Disconnect cable "B" and connect to antenna coupler #3, and adjust C37 for minimum phase shift difference. k. Disconnect cable "B" and connect to antenna coupler output #2, and adjust C38 to minimum phase shift. NOTE In the event the phase shift of any of the antenna coupler outputs are not within ± 2.0 degrees, repeat procedures 2 through 11.		

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

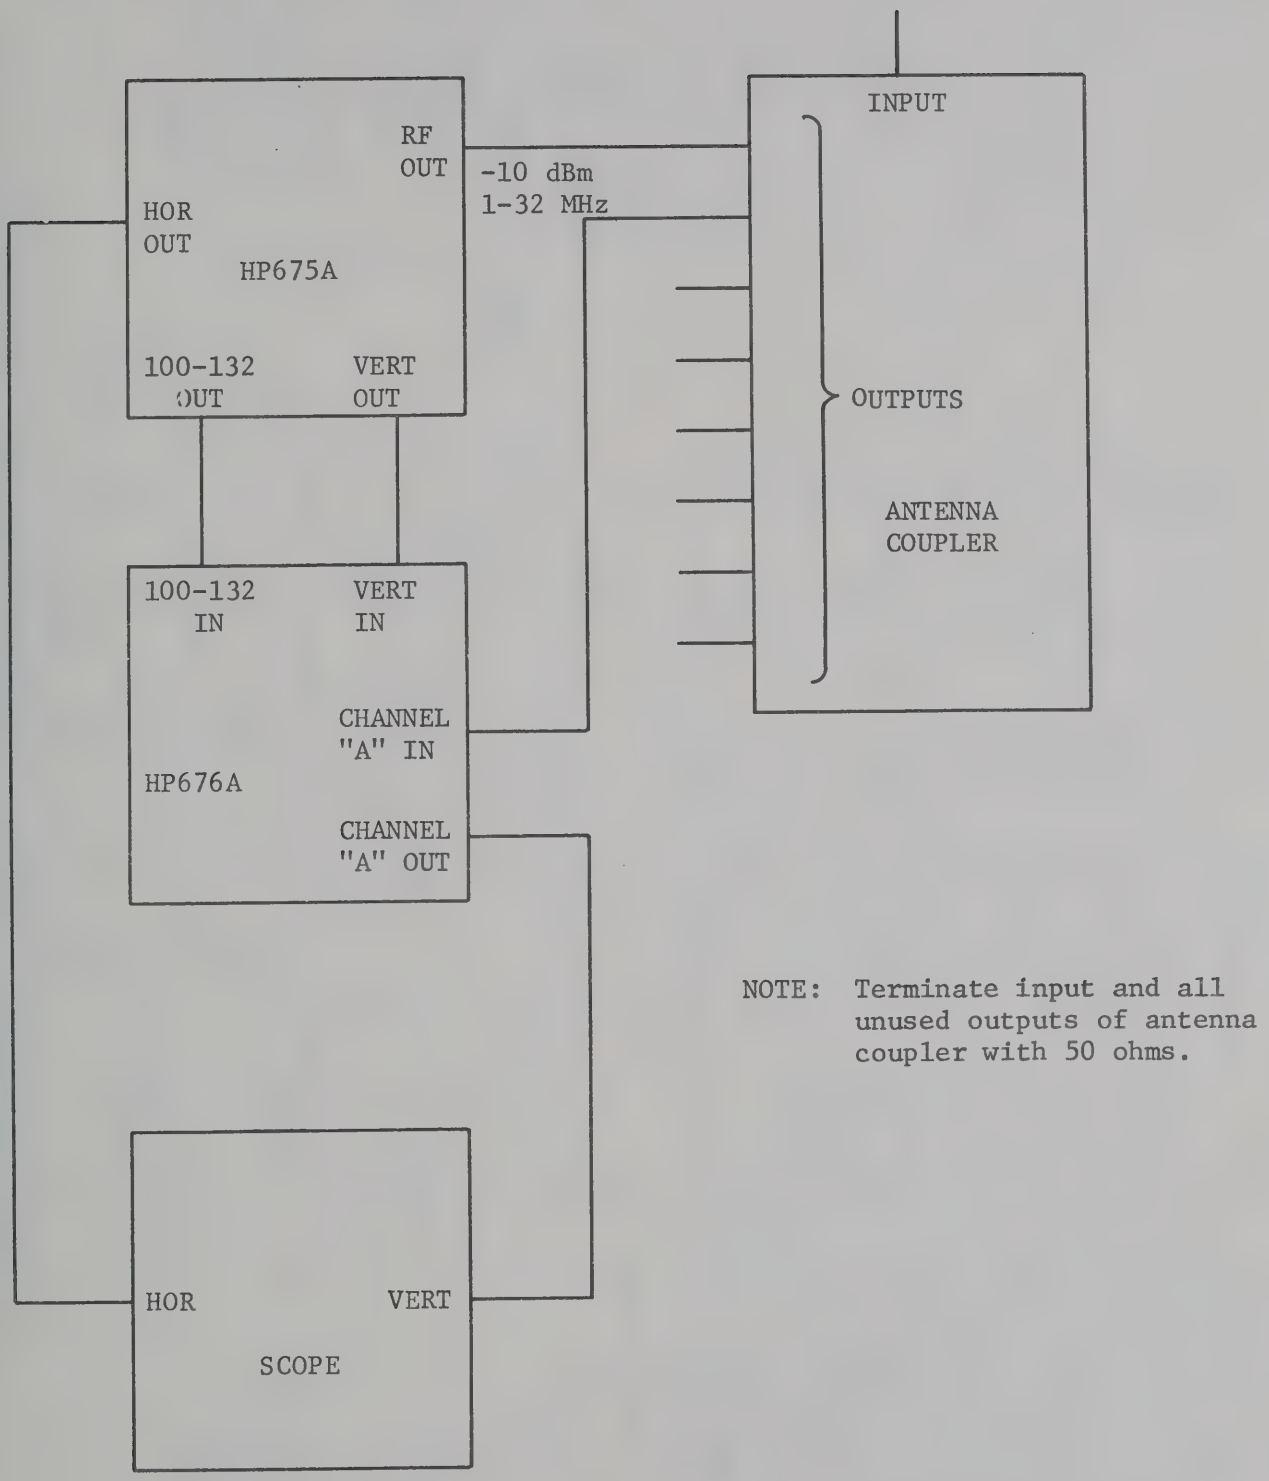
STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
5. Phase Correlation	Network Analyzer Hewlett-Packard 675A/676A Oscilloscope AN/USM-281 (or equivalent)	NOTE This procedure is to be used only when comparing, adjusting or checking phase with a phase STANDARD antenna coupler. If it is desired to check or adjust phase between outputs of a single antenna coupler, refer to procedure 4. NOTE Multicouplers and test equipment must be operating for 4 hours prior to performing this adjustment. a. Connect and calibrate equipment as shown in figure 6-2. Set sweep generator for -10 dBm output, 1-32 MHz. b. With cables "B" and "D" connected to the antenna coupler under test as shown in figure 6-2, adjust capacitor C39 for minimum phase shift difference.	± 2.0 degrees ± 2.0 degrees	

Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST EQUIP FIG. NO.
5. Phase Correlation (Cont)		c. Disconnect cable "B" and connect it to antenna coupler output #2. Adjust capacitor C38 for minimum phase shift difference.	± 2.0 degrees	
		d. Disconnect cable "B" and connect it to antenna coupler output #3. Adjust capacitor C37 for minimum phase shift difference.	± 2.0 degrees	
		e. Disconnect cable "B" and connect it to antenna coupler output #4. Adjust capacitor C36 for minimum phase shift difference.	± 2.0 degrees	
		f. Disconnect cable "B" and connect it to antenna coupler output #5. Adjust capacitor C35 for minimum phase shift difference.	± 2.0 degrees	
		g. Disconnect cable "B" and connect it to antenna coupler output #6. Adjust capacitor C34 for minimum phase shift difference.	± 2.0 degrees	

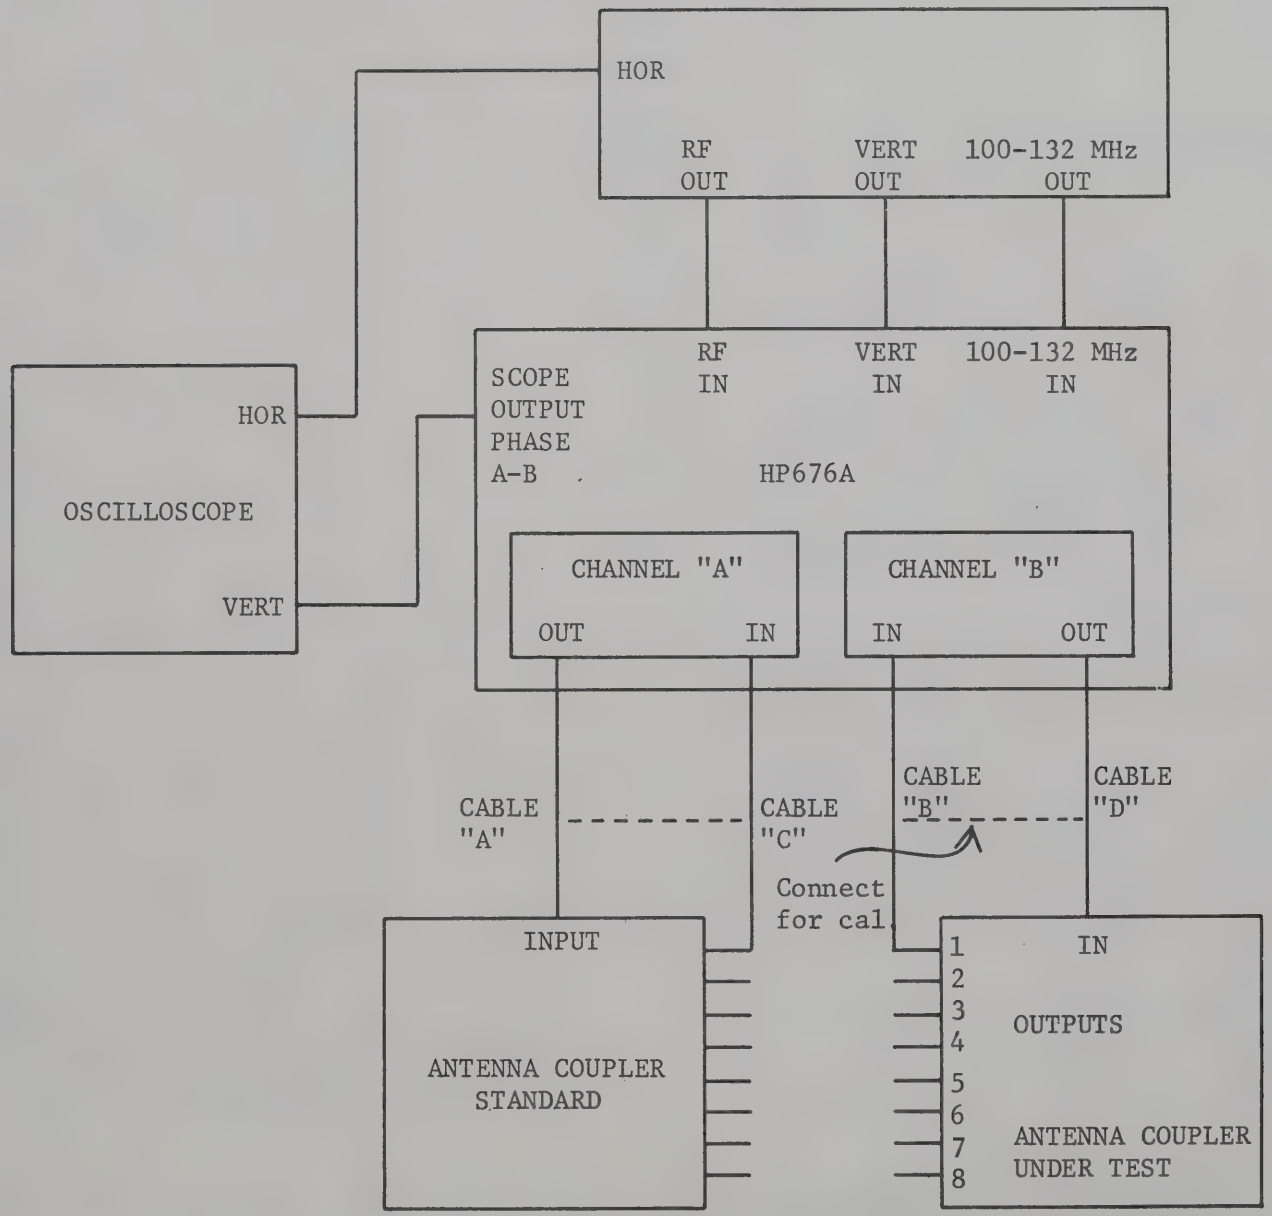
Table 6-1. Antenna Couplers CU-1382F/FRR and CU-1382G/FRR, Overall Alignment and Adjustment Procedures (Cont)

STEP	TEST EQUIPMENT	PROCEDURES	ADJUSTMENT VALUE	TEST SETUP FIG. NO.
5. Phase Correlation (Cont)		h. Disconnect cable "B" and connect it to antenna coupler output #7. Adjust capacitor C33 for minimum phase shift difference.	± 2.0 degrees	
		i. Disconnect cable "B" and connect it to antenna coupler output #8. Adjust capacitor C32 for minimum phase shift difference	± 2.0 degrees	



NOTE: Terminate input and all unused outputs of antenna coupler with 50 ohms.

Figure 6-1. Isolation - Output/Output Bench Test Setup



NOTES: 1. Cables "A" and "C" must be equal in length to cables "B" and "D".

2. Terminate unused outputs of antenna coupler under test with 50 ohms.

Figure 6-2. Phase Correlation Bench Test Setup

CHAPTER 7

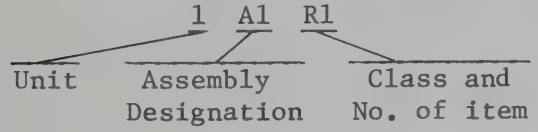
PARTS LIST

7-1. INTRODUCTION.

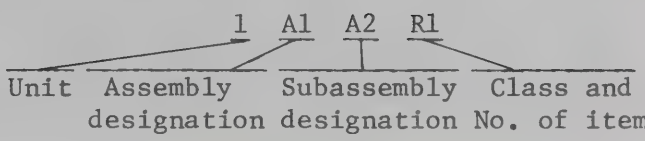
7-2. LIST OF ASSEMBLIES. Table 7-1 is a listing of the assemblies included in the antenna couplers CU-1382F/FRR and CU-1382G/FRR. These are listed by reference designations in numerical order. Thus, when the complete reference designation of a part is known, this table will furnish the identification of the assembly in which the part is located, since the first number of a complete reference designation provides the following information for each assembly listed: (1) official name, (2) designation, and (3) the location of the first page of its parts listing in table 7-2.

7-3. REFERENCE DESIGNATIONS. The numbering method of assigning reference designations has been used to identify assemblies, subassemblies, and parts. This method has been expanded as necessary to cover adequately the various degrees of subdivision of the equipment. Examples of this numbering method and typical expansions of the same are illustrated by the following:

a. Example 1:



b. Example 2:



Read as: First (1) resistor (R) of second (2) subassembly (A) of first (1) assembly (a) of first unit (1).

7-4. Partial reference designations are used on the equipment and illustrations. The partial reference designations consist of the class letter (s) and the identifying item number. The complete reference designations may be obtained by placing the proper prefix before the partial reference designations. Prefixes are provided on illustrations following the notation "REF DESIG PREFIX".

7-5. MAINTENANCE PARTS LISTING.

7-6. PARTS LIST. Table 7-2 lists all assemblies and their maintenance parts, in numerical sequence by reference designation. Maintenance parts for each assembly are listed alphanumerically by class of part following the assembly designation. Thus, the parts for each assembly are grouped together. Table 7-2 provides the following information: (1) complete reference designation of each assembly, subassembly

and part, (2) reference to explanatory notes, (3) noun name and brief description, and (4) identification of the parts location illustration which pictorially locates the part:

a. Column 1, Reference Designation. The parts list is divided and arranged by major assemblies in numerical sequence (e.g., assembly A1 with its subassemblies, parts, etc., precedes assembly A2 with its parts). All parts attached to the assembly are listed first in alphanumerical order, followed by subassemblies with parts, and additional subassemblies with parts, also listed in alphanumerical order, as follows:

Assembly	A1
(Assembly parts)	A1C1
	A1CR1
	A1R1
	Etc.
Subassembly	A1A1
(Subassembly parts)	A1A1C1
	A1A1CR1
	A1A1R1

b. Column 2, Notes. Parts variations within each article are identified by a letter symbol in the Notes column of table 7-2. The absence of a letter symbol in the Notes column indicates that the part is used on all articles covered by this technical manual. Note A indicates that the part is used only on CU-1382F/FRR and note B indicates that the part is used only in CU-1382G/FRR. Note 1 is defined as a selected value as assembly. Note 2 indicates a part (such as a cable) which is not called out on the parts location diagram.

c. Column 3, Name and Description. This column contains the name, including descriptive data and military type number of the item. Those parts not having a military type number include physical characteristics. Following the description are the manufacturer's part number and the contractor's part number.

d. Column 4, Figure Reference Number. This column lists the figure number and item number (enclosed in parenthesis) of the parts location illustration (located at end of the chapter), which shows the physical location of the part.

7-7. LIST OF MANUFACTURERS. Table 7-3 contains the name, address, and code number of all manufacturers supplying items for equipment as referenced in the parts list. This list is in numerical sequence by code number. Code numbers are in accordance with Handbooks H4-1 and H4-2.

7-8. PARTS LOCATION ILLUSTRATIONS.

7-9. Parts location illustrations (figures 7-1 through 7-6) are located at the end of this chapter. Their purpose is to provide positive and rapid location of parts. Column 4 of table 7-2 references the appropriate illustration which pictorially locates the part in the equipment.

CHAPTER 8

INSTALLATION

8-1. INTRODUCTION.

8-2. This chapter provides the information necessary for the installation of the antenna coupler.

8-3. UNPACKING AND REPACKING.

8-4. Unpacking the receiver is accomplished by carefully removing it from its shipping container. Extreme caution should be used in unpacking to prevent damage to controls and connectors.

8-5. INSTALLATION PROCEDURES.

8-6. SITE SELECTION. In selecting an installation site, adequate consideration must be given to the space requirements. These requirements include space for cable bends and removal of antenna coupler, as well as considerations of proximity to associated equipment. See figure 8-1 for the dimensions of the antenna coupler.

8-7. CABLE ASSEMBLIES. Cable assemblies required for installation of the antenna coupler are described in table 8-1.

8-8. PRIMARY POWER CONNECTION. To connect primary power to the antenna coupler proceed as follows:

a. Connect 115 Vac power to AC connector 1J1 on rear of the antenna coupler.

b. Set front-panel POWER switch 1S1 to OFF.

8-9. POWER SUPPLY ADAPTATION. The antenna coupler is designed to operate from a nominal 115 Vac supply. The power input is connected to the 115 volt tap on the primary side of power transformer 1A3T1 in the antenna coupler when shipped. If the supply voltage is not 115 Vac, the input connection must be changed to the appropriate tap (see figure 5-10). To change the transformer tap connection, proceed as follows:

a. Set POWER switch 1A1 to OFF, and disconnect cables to connectors 1J1, 1J2, and 1A2J3 thru 1A2J10 on rear panel of antenna coupler.

b. Loosen front panel screws and slide antenna coupler out of rack.

c. Remove top cover and disconnect cable assembly at power supply 1A3J1.

d. Loosen five screws power supply 1A3 to antenna coupler and remove from chassis.

e. Rewire transformer 1A3T1 per table 8-2 and figure 8-2. Refer to figure 7-5 for location of transformer.

f. Replace power supply 1A3 in chassis, connect cable assembly to 1A3J1, and replace cover.

g. Replace antenna coupler in rack.

h. Reconnect cables that were disconnect in step a above.

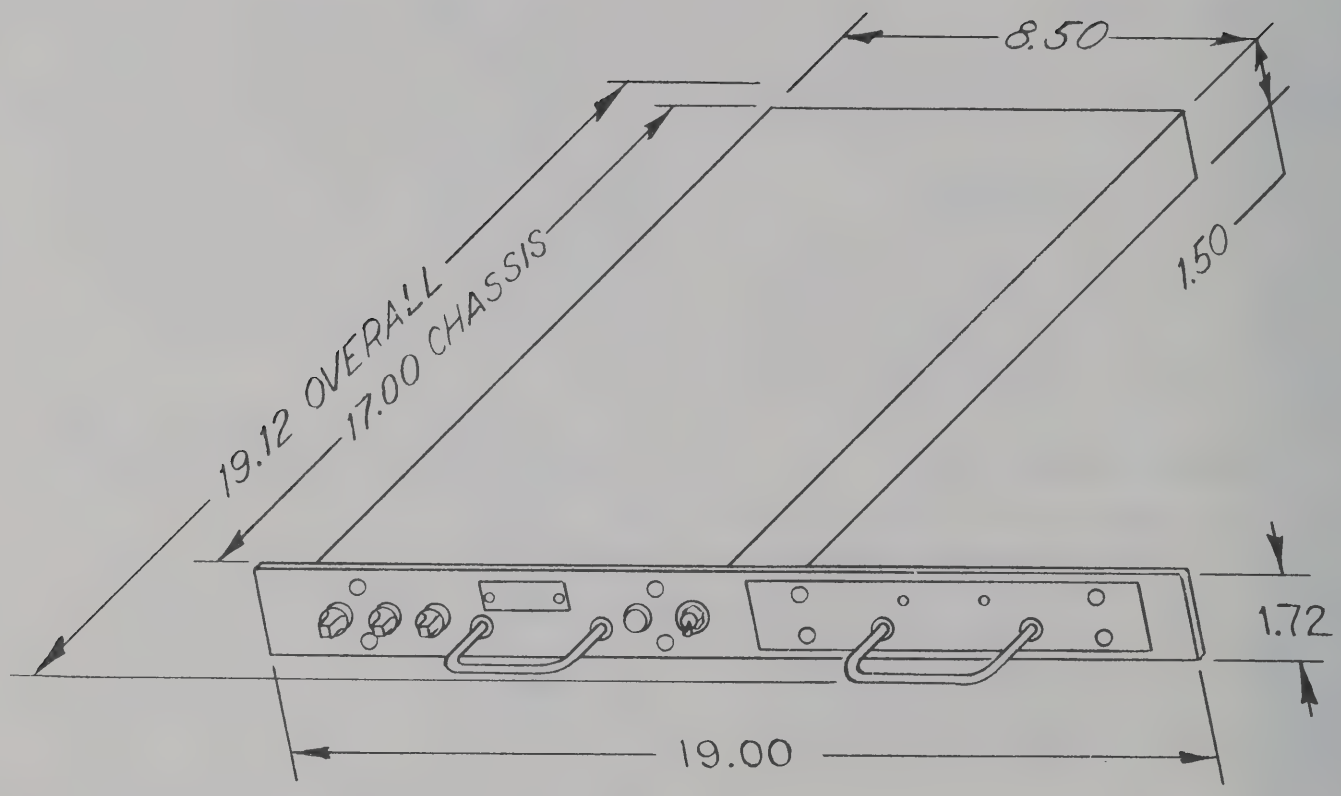

Figure 8-1. Antenna Coupler Outline Dimensions

Table 8-1. Antenna Coupler, Interconnecting Cable Assemblies

CABLE TYPE	NUMBER OF CABLE CONDUCTORS	FROM		TO UNIT
		CONNECTOR PART NO.	CONNECTOR REF. DES.

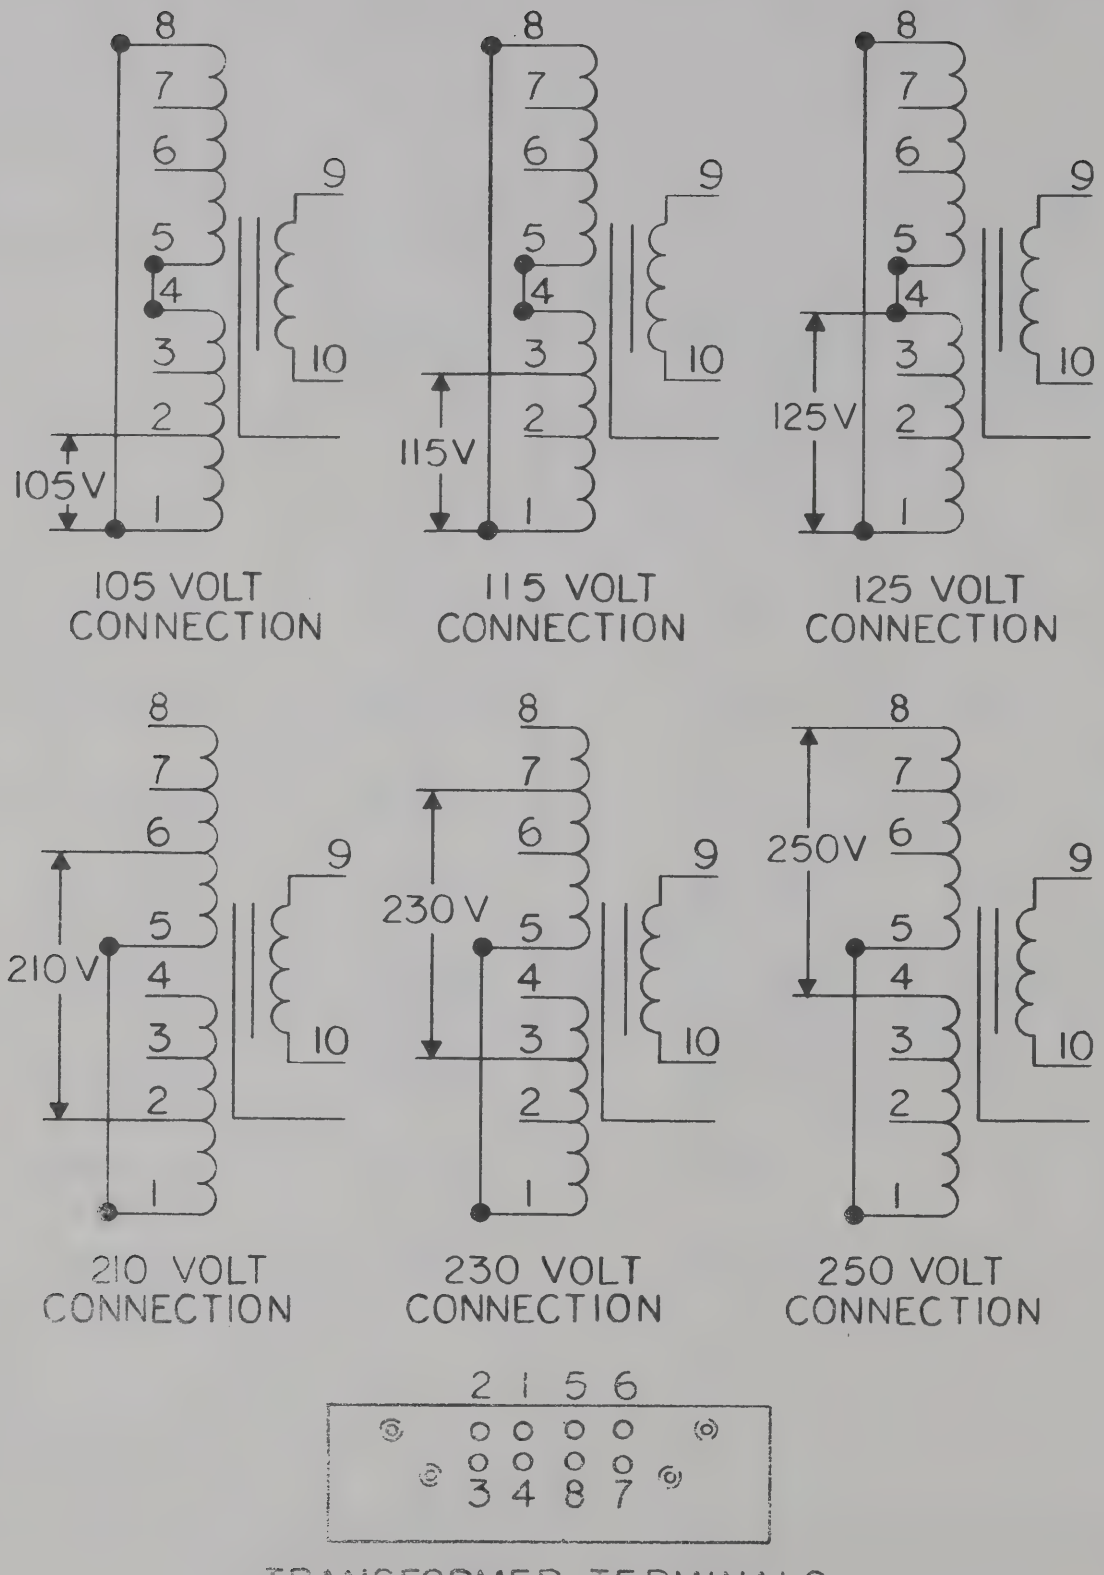
	Coaxial	UG-1094	1A2J10 (1)	Receivers or Termination



NOTE: NORMAL FACTORY SETTING 115 VOLT CONFIGURATION

Figure 8-2. Transformer Connections

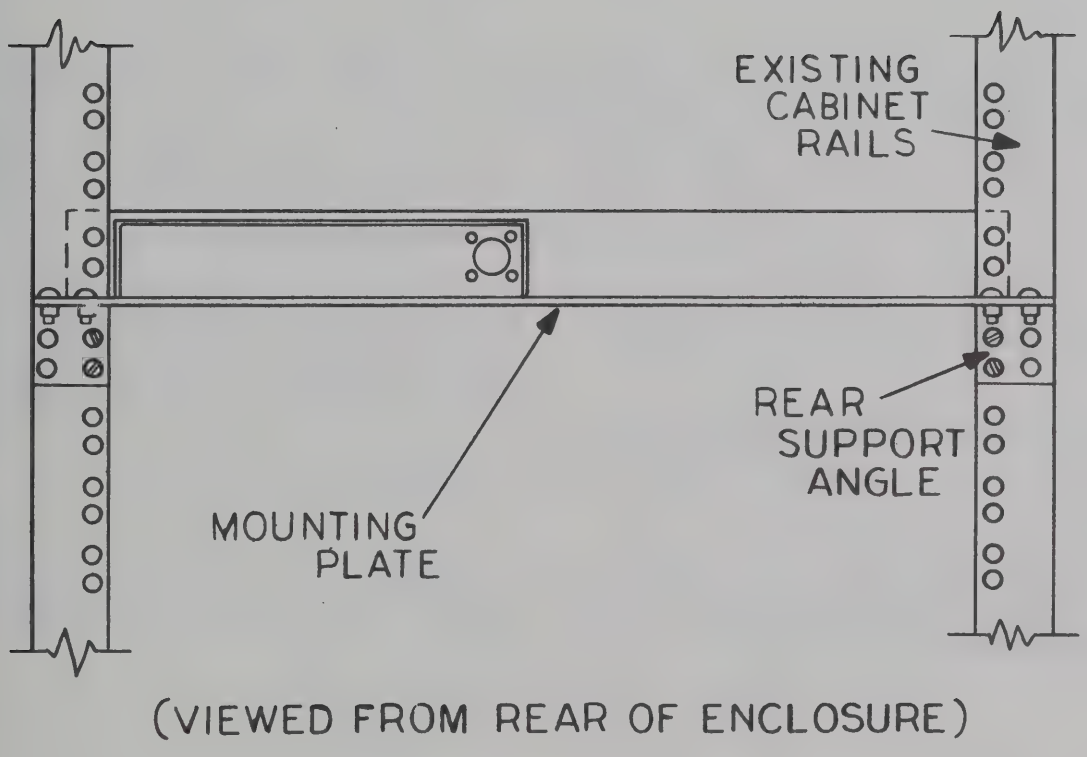


Figure 8-3. Mounting Plate and Rear Support Angles

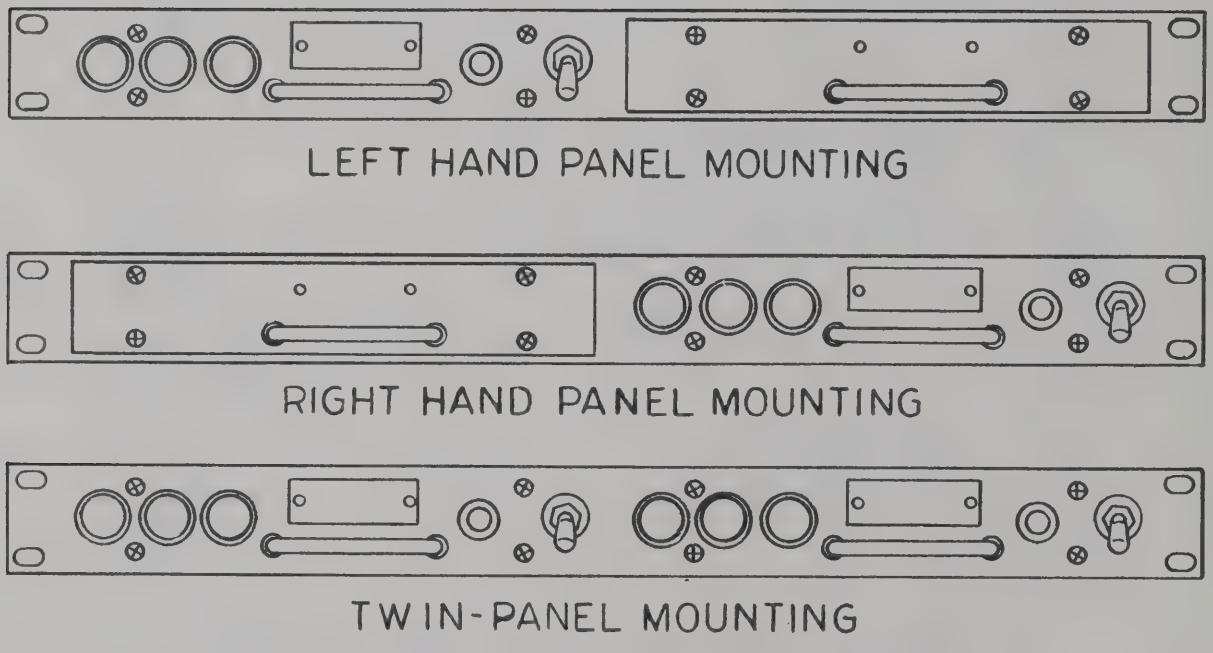

Figure 8-4. Antenna Couplers, Panel Mounting

8-10. MOUNTING. The antenna coupler may be installed in any convenient location at a shore communication facility in a 19-inch rack by means of a mounting plate and two rear support angles. For all required installation dimensions, see figure 8-1. Figure 8-3 illustrates the mounting plate and rear support angles used for mounting the antenna coupler in a standard rack.

8-11. As shown in figure 8-4, the antenna coupler units may be mounted in a variety of mounting configurations, namely: (1) Left-Hand Panel Mounting, (2) Right-Hand Panel Mounting, and (3) Twin Panel Mounting. After the mounting bracket has been installed, slide the antenna coupler into position and secure the front panel with 10-32 x 1/2 screws and washers. The antenna coupler is designed to operate in a maximum ambient air temperature range of -40°C to +50°C (-40°F to +112°F) with normal free convection cooling. If units mounted in an enclosed rack cabinent, forced convection cooling is mandatory. Ambient temperature at hot spots within the rack should be maintained at less than 50°C at all times.

8-12. INTERCONNECTION. All connections are made at the rear of the antenna coupler. Connect the antenna cable to INPUT jack J2 and receiver cables OUTPUT jack 1 thru 8, J3 thru J10. Connect power cable to ac jack J1 to primary power.

8-13. INSTALLATION CHECKOUT.

8-14. PHASE 1 - INSTALLATION INSPECTION AND PRE-ENERGIZING PROCEDURES. The antenna coupler should be carefully checked to indicators and switches, and for loose hardware and knobs. Make sure that all electronic assemblies are firmly seated. Check connectors for dirt, damage to pins, and broken insulators. Replace or repair as necessary. Check that all cables are properly connected and that all fuses are in place.

8-15. PHASE 2 - INITIAL TURN ON AND PRELIMINARY TEST. Turn on power at the POWER ON switch on the front panel. The indicator lamp should glow.

8-16. PHASE 3 - INSTALLATION VERIFICATION TEST. In order to verify proper installation of the antenna coupler, refer to the performance checks for the unit given in Chapter 4 of this manual.

8-17. INSTALLATION STANDARDS SUMMARY SHEET. This sheet is provided for the purpose of recording the results of all installation verification tests and is located at the end of this chapter. Each space is identified by the test and step numbers which provide the instructions for accomplishment.

Table 8-2. Transformer Taps

VOLTAGE AC	OPERATING VOLTAGE VAC	INTERCONNECT		APPLY PRIMARY POWER
105	94.5 to 115.5	1,8	5,4	1,2

APPENDIX A

WARRANTY

A-1. The contractor warrants that for a period of two (2) years after delivery and acceptance or for a period of six (6) months of operation after installation in the operational configuration and site, whichever is sooner, the supplies under this contract will be free from defects in material or workmanship and will conform to the requirements of this contract. Written notice of such defect or nonconformance shall be given by the Government to the Contractor not later than sixty (60) days following the end of the warranty period. If required by the Government within a reasonable time after such notice, the Contractor shall with all possible speed correct or replace the defective or nonconforming item or part thereof. When such correction or replacement requires transportation of the item or part, shipping costs, not exceeding usual charges, from the delivery point to the Contractor's plant and return, shall be borne by the Contractor; the Government shall bear all other shipping costs. This warranty shall then continue as to corrected or replacing supplies or, if only parts of such supplies are corrected or replaced, to such corrected or replacing parts, until one year after the date of redelivery, unless a different period of warranty is specified in the schedule. If the Government does not require correction or replacement of a defective or nonconforming item, the Contractor, if required by the contracting officer within a reasonable time after the notice of defect or nonconformance, shall repay such portion of the contract price of the item as is equitable in the circumstances.
